Because of a divergence of opinion amongst subscribers, we are arranging that when SDC reload the file, the Plasdoc Key Terms will be printable as words in the KD line, and also as four digit serial numbers in the KS line.

* 9. SECTION A MULTIPUNCH AND KEY TERMS

We have to announce that due to a fault in computer processing, all Plasdoc Multipunch, Key Terms and Key Serials as applied from Week B06 to date are suspect.

All Punch Codes and Terms generated by Key Serials 2698-2857 (that is, 'Applications') since 09948B are missing from both online files (SDC and InfoLine) and from the Multipunch Search Files.

Re-runs of the B06-B22 data have now been sent to SDC and InfoLine who will inform users by an online message as soon as the data are available. The Multipunch tape updated to B26 will contain correct data.

* 10. WPI ONLINE FILE POSITION

SDC	Loaded to	Awaiting Loading at SDC
Basics/Equivs.	B35	B39

REPORT OF DECISIONS AND POINTS OF ACTION

RESULTING FROM 1979 CPI SUBSCRIBERS' MEETINGS

Modifications to 25th July Report - 31.10.79

As a result of feedback from subscribers, and further investigation, the following modifications to, and comments on, the decisions given in the above report should be noted.

(1) US Divisions

Reason for restriction to Sections A, B, C and E is that only in these sections is punch coding applied, the divisions being made basic so that the narrower claimed material may be coded.

(2) Australia

Additional bibliographic data now appearing in the Official Journal only applies to accepted patents; whereas it still does not appear for the more interesting unexamined documents.

(8) Inventors

Contrary to what has been reported, we have now decided to have programs written which will permit up to eight inventors to be included on our files, not the three limit as at present. It is anticipated that this feature will be ready around mid-1980. For all but Soviet inventions, the number of inventors will not be restricted to three, but as many as eight will be included. We should point out that any one name is restricted to the first ten letters of the surname, and up to three initials of the given name.

(14) Machine Readable Abstracts

As an experiment, the alerting abstracts of all patents in Electrical Patents Index - starting 1980 - will be searchable and printable on tape and on-line. If the venture is popular and sufficiently useful, it may be extended to other areas badly served by retrieval tools.

(17) SDI Search Facility - restricted access

Contrary to what was reported, we are re-examining with SDC the possibility of arranging for a SDISEARCH facility, making certain that the manual codes are updated at the same time as the bibliography.

In view of this, and because the 'four or more unit' concession has proved detrimental to our pricing structure, as from beginning of 1980 subscribers will only be able to search manual and punch codes for sections to which they have a full basic subscription.

Where subscribers feel that they may wish to search occasionally manual and/or punch codes in sections to which they do not have a basic subscription, a separate ID will be issued for unrestricted access at $120 per hour. Such ID may be withdrawn if, in the opinion of Derwent, usage is greater than 'occasional'.

* (18) Plasdoc Key Terms

When the online files have been reloaded around mid-February 1980, the Plasdoc Key Terms will be printable as numbers and/or descriptors; and the words in the descriptors will be searchable.

(20) On-line Access in Japan

Arrangements have now been completed with SDC who, through their Japanese subsidiary, will have all the Derwent files operating on Orbit IV from a

---

other has one of the above meanings.
(I) are prepd. by subjecting an 8-vinyl-tricyclo[5.2.-

RALSTON PURINA CO 23.01.78-US-871715
F09 (27.08.79) D216-01 '34

computer in Tokyo as from December 3rd 1979. Three Derwent technical people will be giving instruction in Tokyo in December, and an access fee of 28,600 yen per hour will be charge for the first two years at least, with no signing-on fee or minimum usage.

(21) On-line print format

With re-loading of the files early in 1980, the following changes will be made:-

(1) Accession number line AN will have the full Derwent classes transferred to it following the accession number

(2) All priorities will be printed on a single PY line

(3) In the CC line, the Company Code will precede the Company Name, for sorting off-line prints

(4) All dates in search and print file (On-line only, not tapes) will be in Year/Month/Data order, for sorting off-line prints

(5) New line after PI line will contain Publication Date (taken out of PI) then basic patent number (taken out of TI) for ease of correction. The FM line will remain unchanged.

(23) - (27) New Chemical Code

Sub-committee is meeting October 25-26th to finalise proposals to be circulated to all coding committee members who will then meet around February to agree final format to be finally vetted at Spring subscriber meetings. Manuals will then be prepared, our own staff taught the new code as well as subscribers, so that coding proper can start Autumn 1980 or - if thought more prudent - beginning of 1981.

(31) Subscriber respresentative committees

Envisaged that these will meet around mid-February 1980, since we are of the opinion that their best function is to lay the foundation of recommendations to be placed before the full subscriber meetings in the Spring.

* (32) Manuals

Contrary to what was stated in the notice which went out 25.10.79, there will be four editions as given in the appendix. Moreover, due to the fact that the chemical code is being revised Instruction Manual No. 3 will not be ready until towards the end of January 1980.

(39) Electrodoc

Because Chemical Business Database has been abandoned at least for the present because of copyright problems, an Electrical Patents Service known as Electrical Patents Index (EPI) is being started in 1980. It is described in the World Patents Abstracts brochure, and in a special Instruction Manual.

Additional On-line Search Parameters

Following planned to be operational once SDC file reloaded early 1980:-

(a) Basic patentee date, for ranging

(b) All priority dates

(c) Section letters

faces is achieved, and it is not removed by the blood flowing over it. Surfaces treated include those of [illegible]

APPENDIX

INSTRUCTION MANUALS

By the end of the year, all the manuals listed below, with the exception of Instruction Manual No. 3 which will not be ready until the end of January 1980, will be issued in loose-leaf form in binders. All CPI/EPI subscribers will receive free of charge one copy of Instruction Manuals Nos. 1 and 2. All subscribers to Sections B, C or E will receive a free copy of Instruction Manual No. 3 and Section A subscribers a free copy of Instruction Manual No. 4.

Further copies of any one manual may be ordered from our Patents Supply Division at a cost of £5.00, $12.00 or Y3,000.

Each free copy, or each copy ordered, of any manual will give entitlement to receive a binder and replacement pages automatically for at least the next two years.

Ethereal oils extn. from seeds - by repeated extn. with corresp. seed oil and phase sepn. using liquid carbon di:oxide
KRASD FOOD IND RES 25.12.75-SU-304514
(15.12.78) C11b-09/02

Efficiency of extn. of ethereal oils such as coriander or aniseed oil from the seeds, is improved when the raw material is chopped repeatedly in the fatty oil of the same vegetable origin.

This is followed by sepn. of phases and extn. of the oil from the liquid phase with liquid CO_2 at room temp.

Tests show that use of the above method increase the % extn. of e.g. coriander oil from 1.08; to 1.4% i.e. by 30.6%.

Bernat Ya.F., Demidov Yu.S., Evstigneeva N.M., et al. Bul. 45/5.12.78 25.12.75 as 304514 (2pp124)

RALS ★ D23 B/37 ★SW 7900-558
Protein binder prodn. from oil seeds - using lipoidal substances to enhance binding properties, giving high solid content without pigment shock
RALSTON PURINA CO 23.01.78-US-871715
F09 (27.08.79) D21h-01/24

The protein fraction is isolated from oily seeds by using lipoidal substances, esp. substances that promote surface activity to enhance the binding props. of the protein.

The process allows a higher proportion of solids in the coating compositions at a given viscosity. It also eliminates the pigment shock that can be troublesome in the use of water-soluble binders such as oil seed proteins.
22.1.79 as 000558 (-pp1407)

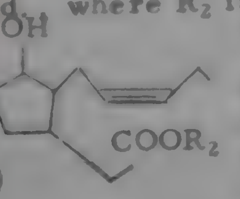
2-(2-Pentynyl)-cyclopentanol derivs. - useful intermediates for jasmone cpds., used in perfumery
OTSUKA KAGAKU YAKUHIN 12.08.77-JA-097181
*E15 (28.08.79) *DT2824-844 C07c-69/74*

A 2-(2-pentynyl) cyclopentanol deriv. of formula (I) is prepd., where R_2 is a lower straightl or branched chain alkyl, alkenyl or aralkyl.



(I)

(I) is prepd. by subjecting a cis-2-butenate deriv. prepd. by the electrolytic oxidation of furfuryl alcohol to a condensation reaction with an acetoacetate; then reacting the intermediate prepd. with pentynyl halid, then subjecting the prod. formed to ring closure directly or after hydrolysis.

The intermediate formed is decarboxylated selectively in the presence of an aromatic solvent and a sulphonic acid catalyst, and reduced in the presence of an aliphatic alcohol solvent and a reducing agent such as lithium aluminium hydride.

The prod. formed is useful as intermediates for the synthesis of jasmonoid cpds., which are important as perfumes. 8.6.78 as 913690(4pp931)

SUNO ★ D23 68038B/37 ★US 4166-796
Friction modifying compsn. - prepd. by co-sulphurising a blend of tri:glyceride, e.g. lard oil and an olefin
SUNTECH INC 15.05.78-US-905909 (19.04.71-US-135466)
E19 H07 (04.09.79) C07g-17 C09b-49 C10m-01/38 C10m-05/22

The compsn. comprises a co-sulphurised blend of 50-90 (pref. 88-70) pts. vol. of a triglyceride (I), the fatty acid moieties (all hydrocarbons) of which contain 9-22C atoms ($\geqslant$45% of them contg. one -C=C- bond) and 50-10 (pref. 12-30) pts. vol. of a 2-24C olefin of formula $R_1R_2C=CR_3R_4$ (where R_1, R_2, R_3 are H or alkyl and R_4 is H, alkyl, aryl, cycloalkyl or alkaryl). The blend contains 16-25wt.% of chemically bound S, of which 5-18wt.% is active. Also claimed is a blend as above contg. 7.5-25wt.% chemically bound S.

The compsn. is used, as a replacement for sulphurised sperm oil, as an additive for friction modifiers in lubricant formulations, e.g. in gear oils, worm and spur gears, transmission fluids, way lubricants, Permawick lubes for sintered bronze or sintered babbit bearings, and as a metal-working oil additive. By sulphurising (I) and the olefin together, the prod. has good lubricity and is soluble in paraffins (separate sulphurisation of the ingredients giving paraffin insoluble prods.). 15.5.78 as 905909 (+24.1.72-US-220399) (8pp959)

LIPT- D23 67306W/41 =US 4166-823
Purificn of crude phosphatides - by treating with a mixt of hydrophobic and aq liqs and recovering the prod from the organic phase
LIPTON T J INC (UNIL) 22.03.74-GB-012927
*(D13) (04.09.79) *BE-827-026 A23j-07 C07f-09/02 + C11c-03*

Transparent phosphatides are produced from crude phosphatide sludge by (a) before alkali refining, treating sludge with (i) an aliphatic, cyclic or aromatic hydrocarbon in an amt. of 200-2000(400-600)vol.% and (ii) H_2O in an amt. of 5-150(50-100)vol.% (the vol.% being w.r.t. phosphatide content of the sludge); (b) sepg. the hydrophobic liq. (i) and the water; and (c) recovering the transparent phosphatide prod. from the hydrophobic liq.

Pref. hydrophobic liq. is a satd. aliphatic hydrocarbon esp. hexane. Pref. vol. of hydrophobic liq. is 1-3 times vol. of phosphatide plus water.

Prod. is improved w.r.t. odour, taste and oil-solubility properties. Prod. can be used in foods e.g., margarine. Process is esp. advantageous when applied to phosphatides which have been hydrolysed by pancreatin.

D24: SOAP; SOAP DETERGENTS

MOLE- D24 31907X/18 =DS 2553-103
Inorganic monomer and polymer complexes contg. metals - for soap production in washing prepns. and plating solns
MOLECULAR ENERGY RE (MERK/) 17.11.75-US-631949 (26.11.74-US-527355)
*A41 E37 M11 (D25) (06.09.79) *BE-835-992 C01g-57*

Inorganic polymer complexes are produced by reacting in an aq. medium $\geq$1 non-alkali metal (NAM) of gps. I-VIII, an alkali metal hydroxide (AMH) and a source of NH_2 gps. The NAM is mixed with the aq. medium and the NH_2 source is added. The AMH is mixed in such a way, the intimate contact between the AMH ions and the NAM is achieved and a region of a pH of nearly 14 is created in the immediate vicinity of the NAM.

The rate of adding the AMH is such, that considerable amts. of NH_2 gps. are bound to the AMH and NAM by an endothermic reaction. The reaction mixt. is allowed to react afterwards exothermically in the reaction vessel. The reaction is terminated by removing excess NAM from the reaction mixt. Aq. NH_3 is pref. used as the source of NH_2 gps. Pellets of AMH are pref. added. The NAM is pref. Si or Al.

The polymers can be produced in contradiction of classical chemical theory. Clear aq. solns. or solid polymers can be obtd. They can be used in chemical or electrolytic metal coating processes, esp. for metals difficult to plate by conventional processes. They can also be used to produce decorative or precious gems. 26.11.75 as 553103 (38pp260)

Sodium percarbonate particles coated with dehydrated sodium perborate - prepd. by spraying with a supersaturated perborate soln. and a silicate soln.
DEUTSCHE GOLD & SILBER 10.03.78-DT-810379
E34 (05.09.79) C01b C11d

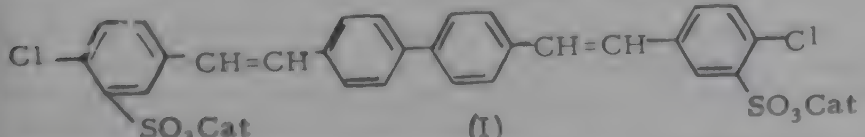
Sodium percarbonate particles consisting of a sodium percarbonate nucleus coated with dehystrated sodium perborate and sodium silicate are prepd. by spraying the percarbonate with a super-satd. soln. of sodium perborate and a sodium silicate solution, followed by drying to eliminate all or part of the added water.

Pref. the sodium percarbonate starting material contains 1-10% by wt. of water, and the sodium silicate soln. used has a compsn. such that the wt. ratio of SiO_2 to Na_2O is 3.2-3.8.

The process is simpler than that of the parent patent yet gives products of practically identical stability. 5.3.79 as 874632 Add to 860762 (8pp1365)

HENK ★ D25 66463B/37 ★DT 2808-927
Liq. detergent for washing textiles - contains di:sulphonated di:phenyl-di:styryl cpd. as optical whitener giving storage stability
HENKEL KG AUF AKTIEN 02.03.78-DT-808927
E24 F06 (06.09.79) C11d-03/42 D06l-03/12

A clear liq. detergent contains anionic, nonionic and/or zwitterionic surfactants, and 0.002-0.4, pref. 0.05-0.25 wt.% diphenyl-distyryl cpd. of formula (I).



(I)

(in which Cat is an alkanolamine, pref. triethanolamine) as optical brightener. The soln. contains $\leqslant$ 0.5 wt.% alkali metal ions and $\leqslant$ 0.04 wt.% alkaline earth metal ions.

The compsn. is stable at high and low storage temps., has high detergent power and gives a pure white brightening. It is also resistant to active Cl cpds., making it esp. useful for medium washing temps. (40-60°C) using Cl bleach cpds. 2.3.78 as 808927(11pp016)

ALBR ★ D25 66536B/37 ★DT 2904-486
Conc. aq. surfactant compsn. forming lamellar phase - contains contains cationic, nonionic and/or further cationic and/or amphoteric surfactant
ALBRIGHT & WILSON LTD 07.02.79-DT-904486 (07.02.78-GB-004817)
(06.09.79) B01f-17 C11d-01/83

Aq. surfactant compsn. consists of 10-55 wt.% water and of a mixt. of surfactants. The mixt. of surfactants consists of $\geqslant$ 5 wt.% of a first cationic surfactant, (I), together with $\geqslant$5 wt.% of $\geqslant$1 nonionic surfactant, (II), and/or $\geqslant$1 other cationic surfactant, (III), which is not homologous with (I), and/or $\geqslant$ 1 amphoteric surfactant (IV). In the presence of water, the mixt. exhibits a ''G''-phase (or lamellar phase) at $\leqslant$ 23°C and the concn. of the active mixt. materials corresponds to that at which the compsn. can exist, at least predominantly, in the ''G'' phase.

Conc. pumpable mixts. can be obtd. allowing economy in transport and storage. The more strongly active compsns. have bacteriostatic properties. The compsns. can be diluted without forming an intermediate gel phase. 7.2.79 as 904486 (31pp200)

Detergent compsn. - comprises 3-methyl-3-methoxy-butanol, specified surfactant(s) and organic assisting detergent selected from organic acids

NISSAN SEKKEN KK 23.01.78-JA-006327

E17 (04.08.79) C11d-03/20

A detergent composition exhibiting no stimulative odour, capable of easilu removing a difficult stain comprises 0.5-15 wt.% of 3-methyl-3-methoxybutanol, $\geqslant$ 1 wt.% of surfactant(s) selected from ethoxylated nonionic surfactant, straight chain alkyl benzene sulphonate and alkylethoxysulphonate etc., and 1-30 wt.% of org. assisting detergent selected from malic acid, glycolic acid, citric acid and tartaric acid.

The water-sol. org. acid, e.g. malic acid etc. is pref. used as the assisting detergent esp. in the removing stains in bath room or wash basin, and an amine, e.g. monoethanolamine, diethanolamine and triethanolamine etc. is used as the assisting detergent in the case of removing stains in ventilation fan etc.

If necessary, an inorg. assisting detergent, e.g. water and pyrophosphate, solubilising agent, perfume, dye-stuff, bleaching agent and anti-septic agent etc., may also be added. 23,1,78 as 006327(4pp34)

KAOS D25 46159Y/26 =J7 9023-870

Bleaching compsns. releasing hydrogen peroxide in aq. soln. - comprising acetylated prod. of ethylene oxide adduct of a polyol with vicinal hydroxyls and a peroxide

KAO SOAP KK 14.11.75-JA-137086

*A97 (A25) (16.08.79) *J52061-187 C11d-07/54*

Compsns. comprise acetylated prod. of ethylene oxide adduct of polyhydric alcohol with vicinal hydroxyl gps. and peroxide producing or releasing hydrogen peroxide in aq. soln.

Polyhydric alcohols are e.g. glycerine, erythritol, glucose, mannose, xylose, sorbitol and sugar. Ethylene oxide is pref. added at 1-3 moles per hydroxyl gp. Peroxides precursors are e.g. sodium perborate, sodium percarbonate and sodium persulphate.

The bleaching compsns. have good solubility in water and good bleaching at ambient temps. 14.11.75 as 137086 C11d-7/54 (16.8.79) KAO SOAP KK (3pp43)(J52061187)

FARH D25 04109Y/03 =J7 9023-914

Alkali phosphates with high degree of whiteness - where vanadium and iron are removed using sodium hydroxymethane-sulphinate (NL301276)

HOECHST AG 28.06.75-DT-528895

*E34 (E12) (17.08.79) *DT2528-895 C01b-25/30*

Process for mfg. alkali phosphate solns. with a low vanadium content, from phosphoric acids, obtd. by the wet process and which contain V and Fe. The V and Fe are converted to their lower oxidn. states by a reducing agent, and the acid neutralised with alkali lyes and/or alkali carbonates to obtain pH $\geqslant$ 3, and a ppte. which is removed. The reducing agent is sodium hydroxymethane-sulphinate (SHMS). The SHMS is pref. used as a soln. in 10-30 wt.% caustic soda lye, esp. using 800-1000% of the SHMS w.r.t. the vanadium present in the phosphoric acid.

The alkali phosphates are converted into washing agents but if any V is present it colours the washing agent and such colouring is extremely undesirable. In treating crude H_3PO_4 contg. 100 kg. P_2O_5 and 0.5 kg. Fe, 1.7 kg. sodium dithionite are needed as the reducing agent. By comparison, for the same amt. of acid only 0.5 kg. SHMS ($NaSO_2$-CH_2OH) is required to reduce V and Fe, and the V removal is quantitative. The SHMS has no smell, is stable in air, and the redn. time required is very short. 25.6.76 as 075391 (clg.28.6.75-DT-528895) C01b-25/30 (17.8.79) HOECHST AG (3pp)(J52005699)

TEXC ★ D25 67361B/37 ★NL 7901-471

Detergent and surfactant ether sulphonate cpds. prepn. - by sulphonating alcohol(s) with an alkali metal hydroxy alkyl sulphonic acid salt

TEXACO DEV CORP 27.02.78-US-881286

E12 H01 (29.08.79) C07c-143/11

Ether sulphonates R-O($R_3$$\rightarrow$$SO_3$A (I) (where R is 2-22C alkyl, alkenyl, hydroxyalkyl or hydroxyalkenyl an aralkyl with 1-18C alkyl gp(s)., a 7-28C aralkyl or one of their polyether derivs.; R_3 is alkylene; and A is an alkali metal cation) are made by liq. phase reaction of an alcohol ROH (II) with a solid alkyl sulphonic acid salt HO-R_3-SO_3A (III) added under reduced pressure of $<$300 mm Hg. A small amt. of (I) is present at the start of the reaction. An inert gas is dispersed continuously through the liq. reaction mixt for at least the greater part of the reaction.

The sulphonation is carried out without using eg. conc. H_2SO_4 as sulphonation agent, thus reducing the problems of corrosion of the appts. and salt formation on neutralisation of the prod. The sulphonation agent (III) is a solid which is soluble in (II), thus allowing improved control over the reaction. The prods. are light coloured liquids, useful as detergents and surfactants, e.g. in oil recovery processess.26.2.79 as 001471(19pp513)

PROC ★ D25 678708/37 ★US 4166-039

Homogeneous spray-dried granular detergent compsn. - contg. clay mineral, alkoxylated nonionic surfactant, and detergency builder

PROCTER & GAMBLE CO 23.06.75-US-589116 (15.10.73-US-406412)

A97 E19 (28.08.79) C11d-01/72 C11d-03/07 C11d-07/02

Homogeneous spray-dried granular detergent compsn. contains: (a) 0.5-40 wt.% naturally derived clay mineral (I); (b) 2-60 wt.% of $\geqslant$1 alkoxylated nonionic surfactants (II); and (c) 5-50 wt.% detergency builder (III).

(I) is a kaolinite (mean particle size $\leqslant$ 1 μ) or bentonite (mean particle size $\leqslant$ 75 μ) free of organic modifying gps. Wt. ratio (II):(I) is 6-1:1-2. (III) is an alkali metal or opt. substd. NH_4 (in)organic builder salt, but a phosphate when (II) is a bentonite clay, and a non-phosphate when (II) is a kaolinite clay.

Stable, homogeneous compsns. do not separate giving an oily phase contg. (II). In addn., compsns. may contain substantial amts. of (II) but do not need phosphate ester couplers. 23.6.75 as 589116 (14pp478)

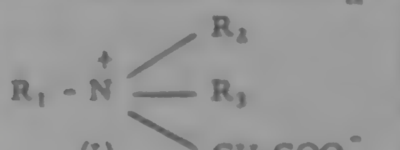
KAOS D25 07609Y/05 =US 4166-048

Nonirritating liquid detergent compsn. - contg. amphoteric betaine surfactant and polyethoxylated alkyl sulphate salts in aq. soln.

KAO SOAP KK 22.09.75-JA-114510

*E12 (E16) (28.08.79) *BE-846-393 C11d-01/14*

A liq. detergent compsn. is prepd. comprising 5-40 wt.% of a mixt. of polyoxyethylene alkyl ether sulphate salts of formula $RO(CH_2CH_2O)_nSO_3M$. and a betain type amphoteric surface active agent of formula (I). the wt. ratio of (II) to the polyoxyethylene alkyl ether sulphate salt mixt. being 0.01-2·1.



$$R_1-\overset{+}{N}(R_2)(R_3)CH_2COO^-$$

(I)

In the formulae, R is 11-16C alkyl, n is 1.0-2.6, such that

hen n is 0, the content of such cpd. is 0-5 wt.%. M is a
nono- or divalent metal ion, such that cpds. having a div-
lent metal ion as M comprise 15-98 wt.% of the entire
nixt. R_1 is 8-20C alkyl, and R_2 and R_3 are each 1-3C alk-
ls.

The detergent compsn. prepd. has high washing power
nd a very mild action on the skin, so as not to cause cha-
ping of the skin or hands. 26.4.78 as 900178 (+21.9.76-
S-725182)(4pp931)

COLG ★ D25 68037B/37 ★US 4166-794

**iq. bleach and fabric softening compsn. - contg. hydrogen
eroxide and cationic amine softener**

COLGATE PALMOLIVE CO 25.05.78-US-909592

E19 F06 (04.09.79) D06m-13/36

Liq. bleach, fabric-softener compsn. comprises (by wt.) (a) 3-10% water-soluble peroxy bleaching agent (I), $\geqslant$ 50% being H_2O_2; (b) 3-25% water-soluble softener (II), $\geqslant$ 50% being cationic amine, and (c) the balance water opt. contg. up to 10% water-soluble lower alkanol, esp. isopropanol. The wt. ratio (II):(I) is 5:7-5:1. Pref. (I) is entirely H_2O_2 and (II) entirely cationic amine. The compsn. pref. has pH 4-5.

Used in the wash, rinse or tumble-dry cycles of laundering processes. The liq. compsn. is easier to dispense than solids; components are compatible and have good storage stability at ambient and elevated temp. It can be used safely on dyed fabrics. 25.5.78 as 909592. (10pp1251)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.

OTT/ D11 64859V/37 =DS 2310-104
ough dividing machine - with slotted slider for outlet of stationary ough chamber
ROTTNER H 01.03.73-DT-310104
*(13.09.79) *DT2310-104 A21c-05*

dividing machine for pastes of high viscosity, specially or dough in bakeries, consists of a funnel with two dough eed rollers at the sides of the bottom outlet. The paste hamber below it acts as vertical guide for an axially movble hollow dividing piston and is bounded by an upper and lower, separately controlled horizontal shutter.

The dividing piston has one or several vertical partitions nd the motions of both shutters and of the piston are coordnated according to a programme. This permits the divison of more than one lump of dough by one machine and one ividing operation so that additional machines and space re saved. 1.3.73 as 310104 (5pp39)

CASE/ D11 54345Y/31 =DS 2701-444
Fully automatic dough portion weighing machine - adjusts portion to correct weight without blockage exerting pressure on dough
CASELI M 14.01.76-CH-000676
*R13 (13.09.79) *DT2701-444 A21c-05 G01g-17/04*

A fully automatic bread dough weighing machine includes a scale arm for the dough which actuates a feeder impeller if the nominal wt. has not been reached. This impeller throws small particles of dough against the dough heap until the scale arm cuts it out by a micro-switch.

The radial feeders of the impeller have a downward inclination and are slightlyconical from the central inlets to the peripheral outlets. The outlet openings lie below the horizontal centre plane of the inlet openings.

This achieves a gentle extrusion of the extra dough quantities and eliminates the risk of clogging. 14.1.77 as 701444 (10pp39)

TAMM/ ★ D11 68453B/38 ★EP ---4-093
Plaited pastry prodn. machine - with contra-rotating funnels and offset discharge nozzles
TAMMINEN T T T 10.03.78-SF-000769
(19.09.79) A21c-03/08 B29c-17
D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

A machine for the prodn. of white bread pastry, plaited to tresses, includes one or two guide funnels which revolve around a vertical axis. They have an outlet nozzle which is offset to one side and receive the dough from an extrusion press through a sequence of belt conveyors.

This is a simple mechanism which is easy to clean. The prod. is of good quality and the parameters of the tresses can be altered within wide limits.
12.3.79 as 100740 (15pp39).
(G) ISR: GB-864185; DT2210845; DS-452211.

COSM/ D11 39915Y/23 =GB 1552-618
Bakery proving cabinet for controlled fermentation of dough - circulates heat transfer air around carriage loaded with dough pieces
COSMAO N E A 13.02.76-FR-003957
*(19.09.79) *BE-851-108 +A21c-09*

A fermentation cupboard gas an outer casing closable by doors in which an inner casing is located spaced from the walls of the outer casing, the walls of the inner casing forming heat exchanger panels, a carriage supportable in the inner casing for pieces of dough, and a mechanism to deliver cooled or heated air to between the space at the rear between the casings and which is then circulated about the inner casing.

Pref. at the front of the side passages between the casing deflectors are provided to deflect the air across the front of the inner casing. The side passages are pref. formed by a stack of horizontal channels.

The dough is treated without contacting the air. 2.2.77 as 004364 (4pp1376)

WERN D11 71038A/40 =GB 1553-172
Dough mixing and kneading machine - with three axial paddles revolving in different circular paths
WERNER & PFLEIDERER 26.03.77-DT-713450
*(19.09.79) *DT2713-450 B01f-07*

A dough mixing and kneading appts. is formed by a cylindrical container into which and from which dough can be introduced through a radial recess, $\geqslant 3$ blades being mounted on a shaft for rotations of different radial extent about the container axis. The outermost blade is adjacent the cylinder wall and the recess has a cover member on its base with an inlet for the dough.

The path distance of all the blades is pref. at least half the container radius. The outermost or all the blades are pref. wedge-shaped. Each blade is pref. convexly curved in the direction opposite to its travel.

The appts. is self-cleaning and can be completely emptied. 2.2.78 as 004185 (5pp1376)

HENK ★ D11 68613B/38 ★GB 2016-045
Prodn. of yeast active in acid doughs - by culturing in presence of a short chain aliphatic carboxylic acid
HENKEL KG AUF AKTIEN 11.03.78-DT-810601
(19.09.79) C12c-11/16

Pressed yeast or dried bakers yeast having improved activity or leavening power in acid media is obtd. by addition of 0.1-10 g of a short chain aliphatic carboxylic acid per litre of culture broth in the final propagation stage.

The yeast has improved leavening power in the presence of propionates, or Ca acetate and acetic acid, which normally have an inhibitory effect on pressed or dried yeast prepd. by normal methods.

The acid added is pref. propionic acid. The yeast cream is dewatered using a nonionic dewatering agent, esp. 0.1-10 wt.% of glycerol and/or urea. The yeast is worked up in the usual manner. 8.3.79 as 008181 (6pp955)

TOMA/ D11 30501A/17 =US 4167-068
Spaghetti drying conveyor - prevents sticking by vibratory motion superimposed to linear belt motion

A system transporting spaghetti laterally during drying comprises a perforated conveyor loosely suspended between end wheels to form transverse depressions to hold the spaghetti, a drive coupled to one wheel and a vibrator so that the spaghetti is aligned in parallel and regularly moved relative to the conveyor and to itself.

The drive may include a ratchet mechanism for rotating a wheel jerkily, or one wheel may rotate eccentrically, or a rotating eccentric may be coupled to a frame carrying the sheels. The conveyor may be a mesh belt or a series of metallic blinds defining shallow pockets.

Commercial baking pan - made from single metal sheet blank with integral elliptical section corner posts
EKCO PROD CO 27.06.77-US-810119
Q32 (11.09.79) B65d-07/42 B65d-21/02

A pan is formed from a single metal sheet and has a rectangular bottom and sides of equal uniform thickness. Adjacent sides are joined by an integral corner post lying within the point of intersection of the sides outer surface planes.

Each post has smooth inner and outer curved surfaces and an elliptical cross-section. Inner and outer surface ends form definable junctions with the sides, and post thickness at the minor axis is more than twice side thickness. The arrangement provides corner strength and easy cleaning. 27.6.77 as 810119 (9pp1358).

Dicing machine - with pressure feed drive for meat bacon sausage etc
REIFENHAUSER T (REI /) 13.02.71-DT-106954
*P41 (13.09.79) *DT2106-954 B02c-18/26*

A cutter to cut meat, sausage or other food into cubes consists of a reciprocating pair of cutter grates and blades, facing a cylinder with a piston actuated by a power cylinder. The constant-speed drive for the cutters also drives a piston pump to feed a hydraulic fluid to the power cylinder. A bypass flow control valve is inserted in the delivery circuit of the pump to control the length of the cut cubes.

The arrangement keeps the length of the cubes constant throughout the entire piston stroke and permits a stepless adjustment of the cube size without rapid or shock-like movements. 13.2.71 as 106954 (4pp39)

Support sleeve for corrugated sausage skin - made of heat shrinkable polyethylene foil with radial holes and reinforced flange ends
HOECHST AG 06.03.78-DT-809585
A97 (13.09.79) A22c-13

A support sleeve, made of a flexible thermoplastic foil, for corrugated hoses, e.g. for use as sausage skin, ready for application to the filling tube of a sausage machine, is capable of extension and shrinkage. It has a number of radial holes for access to a watering fluid and has reinforced flange ends.

The pref. material for the support sleeve is polyethylene foil which is capable of latent heat shrinkage and is shrunk to the hollow hose when it is located over a supporting mandrel.

This prevents the tendency of watered corrugated sausage skin from extending and of causing difficulties in applying to the filler tube or lead to damage. 6.3.78 as 809585 (19pp39)

FEUR/ ★ D12 68253B/38 ★DT 2809-609
Meat mincing machine - with gaps in drive shaft bearing bush flange for hard particle segregation
FEURIG W 06 03 78 DT 809609
P41 (13 09 79) B02c-18 30

A meat mincing machine has in the centre of the perforated disc a bearing bush with a flange on which the hub of the cutter set rests. Recesses in the flange give access to an inner annulus. The latter communicates with the channels produced by flats on the drive shaft in the bearing bush.

Sinews, fibres, gristle, bones and other hard particles can thus be sepd from the minced meat without having to stop the machine. The size of the hard particles can be readily adjusted. 6.3.78 as 809609 (15pp39)

Sausage meat filling device - with calibrating tube and disc maintaining constant filling dia. by braking action
HOECHST AG (KALL) 04.03.78-DT-809385
*(19.09.79) *DT2809-385 A22c-11/02*
D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

Sausage case filler comprises a calibrator which expands the crimped case from inside for filling the mass from the machine fill tube. The calibrator comprises a hollow tube (2) round the exterior of the fill tube to contact the inside of the sausage case (4). The fill tube end of the calibrator is expanded (8) from flexible material, and one straightened part of the case (4b) is drawn over this part (8). The second part (3) of the calibrator is a ring outside the fill tube in contact with the expahded end (8) to control its dia. by altering the pressure exerted on it. A cylindrical wall (13) adjoining the flange (12) on the expanded part forms an opening cone.

Sausage case filling is effected by machine for uniform size and density, at high output. The calibrator ensures controlled expansion of the sausage case during filling, starting from crimped or gathered condition right through to the tying off stage. The tube ensures positive guidance and progressive expansion and the perforations admit the water needed at the filling stage.

Granule coating machine for ice cream - with endless chain taking carrier plates to all application stations
SOC PROD NESTLE SA 10.03.78-FR-007068
Q31 (13.09.79) A23g-03/20 B65b-25

Portions of ice cream are coated with a granular product, e.g. a mixture of ground roasted nuts and almonds, on an endless chain. This moves carrier plates for the portions through the successive stations for sprinkling a base layer, depositing the ice cream, enclosing the portion in a layer of granules and discharging it from the dishes.

This saves all manual labour for the entire mfg. sequence. 14.2.79 as 905605 (13pp39)

DANO- ★ D13 68372B/38 ★DT 2908-639
Animal feed additive for normalising intestinal microflora - contg. live bacteria encapsulated in non hygroscopic material
DANOCHEMO A/S 08.03.78-GB-009115
B05 C03 (D16) (13.09.79) A23k 01 A61k-35 74 C12k-01 08

New prod for use as an animal feed additive contains live bacteria which favourably influence the microflora of the intestinal tract of animals. The bacteria are encapsulated in a material which has a lower water content in equilibrium with air of high relative humidity, the material being suitable for releasing the bacteria in the digestive tract of the animal. Pref. bacteria are Streptococcus faecium Streptococcus faecalis and Lactobacillus acidophilus. The capsule material is pref. polyethylene glycol, solid fat (including fatty acid monoglyceride), free fatty acid, fatty alcohol (including ethoxylated fatty alcohol) or sugar.

Used as curative or prophylactic treatment of animals by combatting pathogenic intestinal bacterial or maintaining the normal intestinal microflora. Encapsulation of the bacterial affords protection against the conditions prevailing during pelleting, etc. of animal feed. 6.3.79 as 908639 (15pp380)

LAIT- ★ D13 68506B/38 ★EP ---4-231

Acidulation of milk using cationic resin followed by acid - used for prepn. of casein and milk serum

LAITERIES H TRIBALL 02.03.78-FR-006006
A97 (19.09.79) A23c-09/14 A23c-21 A23j-01/20 C07g-07

D/S: E(BE, CH, DT, GB, IT, NL, SW).

Two-stage acidulation of milk comprises first treating with a cationic resin to give a pH not less than that at which flocculation occurs, pref. to pH $\not<$ 4.7, followed by addn. of acid.

Also claimed is milk serum contg. $<$ 10, pref. $<$8 wt. % mineral material with an ash alkalinity of $<$750, pref.—$<$500 (as mg. Na_2CO_3 per g of ash). Pref. the milk serum comprises $<$ 3.5 wt.% Cl^- (as NaCl), $<$ 5 wt.% (Na + K + Ca), Dornic acidity $<$40°, and $<$300 mg ash alkalinity (as Na_2CO_3/g).

Prepn. of casein from skim milk comprises stirring with H-form cationic resin to give milk of pH$>$ 4.7 but below initial pH and metalion satd. resin. The milk is then sepd., coagulated to give curds and whey, and the whey is sepd. and used to regenerate the resin. Coagulation is pref. effected by addn. of conc. whey.

Appts. for acidulation and casein prodn. are also claimed.

Use of resin avoids addn. of undesired anions and avoids degradation/denaturation of valuable constituents. Mineral content of obtd. milk serum is less than that of conventionally obtd. material. Amt. of acid needed for acidulation is reduced, thus reducing costs since the resin is recycled.

SAND- ★ D13 68517B/38 ★FR 2410-964

Rodent food and rodenticides in sausage form - contg. a high proportion of water

SANDERS 07.12.77-FR-036821
A97 C03 (10.08.79) A01n-17/14 A23k-01/18

Food products for rodents contain a high proportion of water and are in the form of sausages having a natural or synthetic casing.

The water content is usually 50-80% by weight and the filling may contain a coagulating agent such as a starch. The remainder of the filling is preferably a sterilisable mouse or rat food. The casing may be natural, such as gut, or synthetic such as polyester.

The foods are suitable for laboratory animals and for animals when travelling. If a porton is incorporated, such as coumafene, the products are suitable as rodenticides. By having the food in sausage form, it is not scattered by the rodents and keeps well. The high proportion of water provides, at least partially, the needs of the animals for drinking water. 7.12.77 as 036821 (6pp520).

SERM- ★ D13 68518B/38 ★FR 2410-967

Machine to cut florets from cauliflower stumps - esp. for deep freezing has conveyor and cutters operated by fluid power cylinders

SERMA ENTREPRISE (BRET-) 07.12.77-FR-037754
(10.08.79) A23n-15

Each cauliflower is loaded into a pocket on a horizontal conveyor band which is intermittently advanced by a power cylinder via a free wheel transmission with return spring. The cup is automatically located to position the cauliflower on a vertical axis beneath three cutters symmetrically disposed around the axis. The cutters can descend, moving inwards to meet on the axis, forming the apex of an inverted cone. The apex cuts into the core of the stump, sepg. the florets which fall on to the band. The cutters are displaced by fluid power cylinders.

Machine offers a high output of cleanly detached, undamaged florets. 7.12.77 as 037754 (4pp448).

BRPE ★ D13 68535B/38 ★FR 2411-184

Furfural prepn. and solvent extn. from pentose soln. - obtd. by hydrolysis of plant materials

BP SOC FR PETROLES 09.12.77-FR-037193
(10.08.79) C07d-307/50

Furfural is prepd. by dehydrating, in acid medium, a sugar soln. contg. at least pentoses, obtd. by hydrolysis of lignocellulosic materials. Xylose is converted to furfural which is extd. as it forms a solvent of formula R_1R_2 or R_1-CO-R_2 where R_1 and R_2 are independently: (i) H (but cannot both be H); or (ii) linear or branched alkyl opt. substd. by halogen, nitro, nitrile, amino, thiol, alkoxy, possibly attached to $\geqslant$ 1 heteroatom(s) such as oxygen and substd. by $\geqslant$1 OH gps.; or (iii) aryl or alkylaryl opt. substd. by alkyl, alkoxy, halogen, nitro, nitrile, amino, thiol; the cpd. contains $\geqslant$1 O atom per mol.

This process gives improved yields of furfural. The amt. of solvent, w. r. t. reaction medium, is generally 10:1-1:2, pref. 5:1-3:1. 9.12.77 as 037193 (12pp1319)

Beta:lactose prodn. - by adding specified amt. of water to alpha:lactose and heating under pressure
MEIJI MILK PRODS KK (MEIJ) 10.06.75-JA-069135
*E13 (24.08.79) *J51146-411 C07h-03/04*

A small amount of water at the top of the cylinder (pref. 2-15% basing on the amount of lactose) is added to α-lactose or the material contg. α-lactose, and the mixt. is injected under pressure from an extruder (pref. screw extruder). The temp. of the mixture at the top of the cylinder is elevated to 100-200° C under 5-40 kg/cm^2 pressure by the frictional heat and heat of compression, and α-lactose is thus converted to β-lactose. Obtained β-lactose or β-lactose contg. prod. may be dried and crushed if necessary.

If the amt. of water to be added is over 15%, injected β-lactose which is once generated by the conversion from α-lactose, becomes muddy and turns back to α-lactose again if it is allowed to stand in such state. If the amt. of water is 4-7%, the injection may be performed smoothly and injected product contg. β-lactose is the slurry containing only small amt. of water, and this water is evaporated at once and the amt. of water is reduced to 1-5%. Therefore, the conversion back to α-lactose may be hardly caused.

The process may be useful for the preparation of the r material for modified powder milk, baby food, and health diets. The prod. is moreover, superior in the crumbling resistance and binding power as well as in the sweetness, therefore, it serves quite well for the improvement of bulking agent for tablets of medicines. 10. 6. 75 as 069135 C07h-3/04 (24. 8. 79)MEIJI MILK PROD. Pref. (I) is used in a ruminant feed material as a feed additive premix.

(I) is prepd. by cultivating a strain of Streptomyces Sp. X-14547 in an aq. carbohydrate soln. contg. nitrogeneous nutrients and mineral salts. 20.4.78 as 898054 Div. ex 4100171 (1?pp).

KEMI- D13 52805B/29 =US 4167-584

Stable emulsified liquid starch prod. - for adding to dried animal feed (PT 22.6.79)

KEMIN INDU INC 09.01.78-US-867809
*C03 (11.09.79) *DT2824-830 A23k-01*

Animal feed consists of 90-95 wt.% dry feed and 5-10 wt.% (dry basis) stable emulsified liq. starch prod. which is free of non-protein nitrogen additives and comprises 45-85 wt.% edible liq. The compsn. further comprises 15-55 wt.% whole starch-bearing material emulsified with the edible liq. and 0.25-1 wt.% of a preservative mixt. for mould prevention to provide an emulsion which is stable for 3-6 months, but is conveniently pourable. The starch-bearing material is cooked, gelatinised and (partially) enzymatically hydrolysed. Most of the particles of the emulsion do not exceed an average dia. of 300 µ.

A method is claimed for feeding monogastric animals, ruminants, and pseudo-ruminants, the animals achieving a feed efficiency and wt. gain equal to results obtd. on dry feed basis, by replacing 5-10 wt.% of animal feed with the above. 9.1.78 as 867809 (6pp963)

HEAT- ★ D13 69831B/38 ★US 4167-585

Heating and cooking food articles in closed chamber - with heated concurrent process vapour moistened by intermittently released steam

HEAT & CONTROL INC 21.11.77-US-853503 (02.02.73-US-328925)
Q77 (11.09.79) A22c-17 A22c-25 F27b-09

In a continuous process for heating and cooking foods in discrete pieces, the food is moved through a treatment chamber on a conveyor. A gaseous process vapour is rapidly and continuously circulated through the chamber concurrent with the movement of the food pieces. The vapour is heated to 165-600°F and has a temp. differential of 295-560°F with the food pieces.

The centre temperature of the food pieces is raised to 140-195°F and saturated steam is intermittently released into the chamber to raise the moisture content of the vapour. External air is continuously removed from adjacent the chamber inlet and outlet openings to substantially remove external air from the process vapour. The moisture content of the circulating vapour is continuously monitored and this value is used to control the intermittent release of the saturated steam into the chamber.

The process is used in the heating and cooking of food articles such as meat patties. The moisture content of the food article is controllable while it is handled as little as possible to preserve its shape and avoid crumbling. 21.11.77 as 853503 C.i.p. 3947241 (+27.1.75, 1.3.76 - US-544393, 662512) (19pp295).

CHAN/ ★ D14 68542B/38 ★FR 2411-259
Fabrics incorporating elastic pref. silicone rubber cords - anchored by latex impregnation, used esp. for mfr. of dairy produce filters
CHANET J H 06.12.77-FR-037285
A88 F07 P13 (10.08.79) A01j-25/13 D03d-15/08 D06m-15/66

An elastic ribbon is made by enclosing cords of silicone rubber in a woven fabric and then impregnating the fabric with sufficient silicone rubber as a latex to anchor the rubber cords in their position within the fabric.

Prod. is suitable for prodn. of elastic sleeves for covering rigid objects, esp. for filters for covering cheese moulds. The rubber cords may be conc. in part of the fabric area so that the fabric is elastic in both the longitudinal and transverse directions. Pref. the rubber is self-curing. 6.12.77 as 037285 (8pp515).

RHON ★ D15 68134B/38 ★BE -874-809
Contactor for substances in different phases - incorporates double-walled annular body terminating in restricted opening surrounding axial pipe giving uniform contact and simple cooling
RHONE-POULENC INDUSTRIES 14.03.78-FR-007248
A35 E36 J02 (13.09.79) B01j

An appts. for contacting substances in different phases incorporates an axial pipe, through which solid, liquid or semi- liquid phases are charged and an annular space terminated by an opening or restricted section through which gases, e.g. air, are charged. The axial pipe debouches at the level of the restricted opening. The annular space is defined by a rigid axially symmetrical element closed except at ist downstream part. It is divided into two by a distributor which is mechanically independent of the rigid element, and it has a tangential inlet.

The rigid element is pref. double-walled, with an axial cavity in which the axial pipe fits, and terminated at its downstream part by two convergent concentric truncated cones surrounding the axial phase inlet pipe. A cooling agent flows between the two walls. The distributor is pref. removable and constituted by a perforated cylinder cutting the cones.

The appts. can be used to carry out a great number of processes, e.g. evapn.; concn.; dry mixing; chemical reactions e.g. treatment with sodium hydroxide of a gas contg. CO_2; treatment of thermosensitive materials; co-pptn. of a soln. of latex and a silica; treatment of waste waters. 13.3.79 as 874809 (13pp1192)

INSF ★ D15 68136B/38 ★BE -874-818
Cleaning polluted surfaces, esp. water covered with oil - using powdered mineral silicate and specified surfactant
INST FRANCAIS DU PETROLE 21.03.78-FR-008085
A97 E17 H03 P43 (D25) (14.09.79) B08b C11d

Surfaces polluted by hydrocarbons, fats, oils and analogous materials are treated by spreading on the surface (a) $\geq$1 powdered mineral silicate and (b) $\geq$1 surfactant of hydrophilic/liplphilic (HLB) ratio of $\leq$12 as a soln. or emulsion in a polar or non-polar liquid, the amt. of surfactant being 0.5-5% of the mineral powder.

The process is partic. applied to sea and inland water, sand, rocks, factories and roadways. The treatment has the advantage of an adsorbing action and ensures the biodegradation of the polluted material. It also avoids the environmentally unfavourable action of dispersant surfactants. 14.3.79 as 874818 (10pp597)

MIRK- ★ D15 68156B/38 ★BE -876-048
Flotation separator partic. to skim surface oil from sewage - is inexpensively constructed and easily adjustable for searching sepn.
MIRKOZ DIESEL HUTOT 05.05.78-HU-MO1013
J01 (03.09.79) B01d C02c

Separator is of the type in which the liq. is directed in laminar flow longitudinally through an oblong tank. Surface liq. is driven by fluid from nozzles above the liq. To rise up a skimming blade attached to a float.

The blade makes an acute included angle with the surface, into which its lower edge cuts to a level below the layer of floating impurities. The upper edge of the blade is seamed to the top ot an open-bottomed collecting sump fixed to the float. The sump top is above and its bottom well below the liq. surface.

The sump contains an outlet passage flexibly piped to a discharge from the tank. The mouth of the outlet passage is above the level of liq. surface in the tank but below the surface of the layer of impurities collected in the sump.

Purificn. of sewage by removal of polluting oil. Recovery of the oil for economic utilisation, e.g. combustion in burners of heating boilers. Simplicity of construction coupled with very searching sepn. e.g. from 5.28 m^3 of polluted sewage it is possible to recover all but 0.2 litre of oil from a total of 28.7 litres. 4.5.79 as 876048 (10pp)

Effluent water treatment - with anaerobicpretreatment in fluidised bed of microorganisms on an inert carrier, followed by aerobic treatment
CIBA GEIGY AG 03.06.75-CH-007125
(15.08.79) C02c-01/17

Parent patent describes a process for treating effluent waters in which the water is first treated under anaerobic conditions with microorganisms on an inert carrier, and the water is then treated under aerobic conditions. In this addn., improved results are now obtd. if the anaerobic treatment is carried out with microorganisms on an inert carrier in a fluidised bed.

Pref. the anaerobic treatment is carried out in a fluidised bed of anaerobic bacteria mounted on a carrier such as active charcoal, coke, slag, pumice, porous ceramic, etc. The anaerobic pretreatment is carried out e.g. at pH -8, esp. 7 and a temp. of 10-40 (20-30)°C. After the anaerobic pretreatment in a fluidised bed, the water is subjected to a normal anaerobic treatment. 3.6.75 as 007125 Add. to 582630 (3pp513)

Automatic control programmer for water softening plant - in which regeneration is related to output flow and feedwater hardness value

HEYL GEBR KG 08.01.73-DT-300606

*+R43 (13.09.79) *BE-809-516 C02b-01/76*

A switching circuit to trigger the regeneration period of a water softening plant produces the triggering pulse as a function of the water quantity, counted by a water meter as quantity count pulses and of the average water hardness. A time controller, pref. a univibrator with an adjustable pulse length, actuates at each received count pulse for an adjustable period of time a time integrator which triggers the switch mechanism after a pre-set integration interval.

This control circuit is simple and can be produced at low cost. It can be easily adapted to a different water hardness without interfering with the water meter. 8.1.73 as 300606 (6pp39)

MENZ- D15 75972V/44 =DS 2310-978

Activated sludge purificn tanks - ventillated by compressed air, with submerged rotating tube turbines

MENZEL & CO GMBH 06.03.73-DT-310978

*(13.09.79) *DT2310-978 C02c-01/06*

An aeration tank for a biological sewage treatment plant of circular or polygonal cross-section has in the centre of its flat bottom a flow deflecting cone. The compressed air aerator tubes are arranged in a radial pattern from this cone to near the outer tank wall. A propeller inside a short tube near the side wall ensures that a circular motion of the sewage is maintained.

The higher velocity near the tank walls leads to an inward flow component which is deflected upwards as it meets the central cone. This rolling motion is superimposed on the circular motion and ensures a max. intake of oxygen in the sewage. 6.3.73 as 310978 (5pp39)

VEKE- D15 45323V/25 =DS 2324-351

Sewage treatment sludge concentrating plant - with improved heat recovery from treated concentrate to incoming raw sludge

VER KESSELWERKE AG (VERE-) 14.05.73-DT-324351

*(13.09.79) *BE-808-258 C02c-03*

A plant for the conditioning of sewage sludge consists of a high-pressure pump, an indirect heat exchanger and a reactor to condition the sludge at high pressure and high temp. An automatically controlled pressure reducing valve is arranged between the heat exchanger and the reactor to maintain a constant pressure differential between inlet and outlet or a constant pressure at the inlet.

This permits a higher pressure and temp. to be maintained in the heat exchanger than in the reactor, with the result that the incrustations of the heat exchanger surfaces on the sludge side are eliminated. 14.5.73 as 324351 (4pp39)

Multiple effect evaporator for desalinating seawater - cools energising steam feeding exchangers, preventing incrustation and facilitating gas venting

SASAKURA ENG CO 20.04.76-JA-U49638

*J01 +Q78 (13.09.79) *BE-853-753 B01d-01/04 B01d-03/04 C02b-01/06*

A fluid is distilled by spraying it on horizontal banks of tubes, arranged on top of each other and passed by heating steam at the high temp. The number of tubes in each bank is reduced in the direction of flow of the steam and the steam condensation transmits heat to the sprayed fluid, causing it to evaporate, followed by condensation.

The banks of tubes are passed by the steam in a cross counterflow to the sprayed descending fluid. Before the steam is injected in the banks of tubes, it is cooled through the condensate, formed in one of the upper banks.

This prevents any scale deposition by too high a steam temp. and results in a higher thermal efficiency. 20.4.77 as 717543 (6pp39)

D/S: E(CH, FR, GB, IT).

Water is obtained from atmospheric air by drawing a first stream of cool moist air from the atmosphere and passing it through an absorber contg. a water absorbing medium so that water vapour is given up to the medium, and passing a second air stream through a heat cycle, in which it absorbs heat from a hot body, and then through the adsorber to heat it, and to collect bound water from the water-adsorbing medium. The air is then passed through a condenser where the collected water is condensed, collected and removed, while the second air stream, relieved of its water, is recycled.

Specifically, the second air stream (D) is first passed through the complete cycle, except the condenser (7) i.e. through the heater (4) and the adsorber (5) and at a predetermined point after taking up water, the air stream is split into two parts (D1, D2), the first of which is passed back through the adsorber and the second passes through the condenser.

An increased yield of water is obtd.

2.2.79. as 100305 (27pp396).

ank installation to inject gas into liq. esp. waste water - to be erated via submerged rotor with hollow perforated blades

JEUMONT-SCHNEIDER 06.12.77-FR-036708

(10.08.79) C02c-01/10

he installation is of the type in which liq. in a tank is njected with gas from a submerged rotor near the ase of the tank.

A compressor outside the tank supplies gas to the ollow hub of a rotor having perforated, hollow, helical lades. The rotor has a coaxial shaft extended upwards ut of the tank to be power driven at between about 30 nd 300 r.p.m.. The rotor is enclosed in a cylindrical asing with upward, bell-mouthed inlet and downward, ell-mouthed outlet.

Blade perforations are pref. in the blade face operating at suction pressure during rotation. The casing outlet is pref. connected to a number of radial distribution ducts leading towards the tank periphery. The ducts are pierced throughout their length withoutlet holes.

Used for injecting gas into a liq. esp. for aerating waste water to be purified. Slow speed of rotation allows excellent contacting of liq. with diffused gas. The installation operates silently with its submerged rotor turning smoothly. No mist is sprayed up to pollute the atmos.. 6.12.77 as 036708 (7pp448).

A93 Q42 (10.08.79) C02c-01/10 E03f-05/18 E03f-11

Unit is of the type which has an aeration tank in which oxygenation is effected by diffusion of compressed air. A network of pipes distributes air in the base of the tank. Each distribution pipe has a number of branch pipe stubs. The outer end of each stub is fitted with a removable diffuser nozzle made of synthetic, porous, elastic sheet material, partic. polyester foam.

The surface area of the diffuser nozzle is pref. greater than the cross-sectional area of the pipe stub. In partic. the nozzle is spherical in use and has a sleeve extension which fits on the stub and is secured there by a clamping collar.

The diffuser nozzle does not choke up over very long periods of use. If and when it does, it is very easily removed for backflushing.

Additional diffuser pipe stubs can be added. Air flow through each nozzle is individually adjustable. 8.12.77 as 037757 (9pp448).

Recovery of precious metal values from waste water - by their bacterial incorporation into organic sludge

WORLD RESOURCES CO 22.11.76-US-743745 (17.03.77-GB-011364)

*M25 (19.09.79) *US4033-763 C22b-05*

Selected metal values which each appear in concn. 0.1-500 ppb together with other metal values which appear in a greater concn., are recovered from water which has been mixed with a bacteria contg. organic material.

The metal values are captured from the water by bacterial imbibing of the values to immobilise and concentrate the values into the organic material. The organic matter is then coagulated and dewatered to separate off the organic matter as a sludge. The dewatered sludge is then burnt off to eliminate the organic matter and form an ash contg. the selected and other metal values. The selected metal values are then recovered from the ash.

The process is esp. used where the selected metal values are precious metals, such as gold, silver and platinum, being recovered from sea water or freshwater lakes and streams. 17.3.77 as 011364 (9pp931)

Mfg. additive for neutralising acidic waste water - using sludge discharged from mfr. of cement prods., sedimenting to water and flocs dewatering flocs and granulating

SHINETSU ENG KK (NAKA-) 26.01.78-JA-007712

L02 (11.08.79) C02c-03 C02c-05/02

Sludge discharged from mfr. cement products, e.g, asbestos slate plate, asbestos-cement pipe, cement tile, concrete block, etc., is used. The sludge is supplied to a slant plate type sedimentation tank to separate water and flocs. The flocs thus sepd. are dewatered, solidified, and crushed into granules of a grain size of 20-50 mm.

The solidified cement sludge has a compressive strength of 100 kg/cm² 2 weeks after solidification, 170 kg/cm² after 4 weeks, and much the same strength as crushed stone after 2 months. pH of the solidified sludge is nearly neutral 2 months after solidification. The crushed prods. are applicable as landfill and reclamation materials and as aggregate for concrete. 26.1.78 as 007712 (5pp117)

KANK- ★ D15 68954B/38 ★J5 4102-053

Treating waste water contg. hexa:methylene:tetramine - by adjusting to acid pH and then hydrolyzing opt. at elevated temp.

KANKYO ENG KK 26.01.78-JA-006739

A21 E13 (11.08.79) C02c-05/02

In the treatment of waste water contg. hexamethylenetetramine, e.g. from melamine resin industry, urea resin industry, phenol resin industry, foundries, etc., the pH of the waste water is regulated to < 1.5 by addition of inorganic acid, e.g., sulphuric acid, hydrochloric acid, nitric acid, etc., and then hydrolysed at from ambient temp. to > 90°C.

The hydrolysis decomposes hexamethylenetetramine into formaldehyde and ammonia with high efficiency and this greatly reduces COD_{Mn} (chemical oxygen demand of hexamethylenetetramine) by a simplified operation and at lower cost. For example, the COD_{Mn} of waste water can be reduced by approximately 50%. 26.1.78 as 006739 (2pp117)

KANK- ★ D15 68955B/38 ★J5 4102-054

Polluted water treatment e.g. leached water from dumps etc - by adding an iron salt to give ferric hydroxide flocs and solid-liq. sepn. treatment

KANKYO ENG KK 26.01.78-JA-006740

(11.08.79) C02c-05/02

Treatment of polluted water, e.g., leachate from wastes-reclamation and dumping sites, etc., is new. An iron salt, e.g. ferric chloride, ferrous sulphate, etc. is added to leachate discharged from e.g. wastes-reclamation site, to cause the formation of the ferric hydroxide flocs to take place, and then the heated leachate is adjusted to pH 3-5.5 and then subjected to solid-liq. sepn. treatment.

Method is capable not only of effectively removing great many organics and colouring matters present in polluted water by using a very small amt. of coagulant but also of obtaining highly purified treated water opt.with activated carbon treatment by providing smaller scale adsorber than the conventional methods, thus offering an economical and effective means for the treatment of polluted water. 26.1.78 as 006740 (3pp117)

KANK- ★ D15 68956B/38 ★J5 4102-055

Treatment of waste water contg. hexa:methylene tetramine - e.g. from melamine resin mfr., by adding acid for hydrolysis, adding alkali, oxidising in presence of iron salt and adding alkaline cpd.

KANKYO ENG KK 27.01.78-JA-007378

A21 E13 (11.08.79) C02c-05/02

Treatment of waste water, e.g. from melamine-urea-,or phenol resin mfr., comprises first regulating the pH to < 1.5 by the addn. of an acid, e.g. H_2SO_4, HCl, HNO_3 etc. for the performance of hydrolysis whereby hexamethylenetetramine is decomposed into formaldehyde and ammonia.

pH is then regulated to 2-3.5 by the addn. of an alkali, e.g., caustic soda, slaked lime, $CaCO_3$, etc. and then subjected to oxidn. treatment using H_2O_2 in the presence of a Fe(II) or Fe(III) salt. Finally the treated water is regulated in pH to < 4 by an alkaline cpd. (sic) to effect hydrolysis of the Fe salt.

Process removes > 95% of COD_{Mn} and formaldehyde formed in the waste water. 27.1.78 as 007378 (5pp117)

NIGE- ★ D15 68965B/38 ★J5 4102-183

Colorimetric analysis of low concn. hydrogen peroxide soln. - by adding phenolphthalein and cupric sulphate soln. to peroxide sample agitating, standing and determining absorbence at specific wavelength

NIPPON GENSHIRYOKU (TOKE) 30.01.78-JA-008276

E36 J04 R16 (11.08.79) G01n-21/02

H_2O_2 in very dilute soln. is quantitatively analysed by a colorimetric method comprising (1) taking 30 ml. of the H_2O_2-contg. soln., accurately, into a beaker, (2) adding, to the sample soln., 0.3 ml. of 0.004 M phenolphthalein alkali soln. and 0.3 ml. of 0.0004 M cupric sulphate soln. (3) agitating gently, followed by allowing to stand for several minutes, (4) transferring the mixt. into a 50 mm colorimetric cell and determining absorbance of the mixt. at the wavelength of 540 nm, and (5) comparing the resulting absorbance with a previously prepd. calibration curve to determine H_2O_2 concn. in the sample soln.

The method is used for monitoring H_2O_2 concn. in boiler water, etc. The method shows good linearity in the range 0.5-100 ppb and can easily be practised by an automatic on-line monitor system. 30.1.78 as 008276(5pp173)

TEIJ ★ D15 69015B/38 ★J5 4102-291

Permselective membrane prepn., e.g. for water desalination - by reacting di:halo ether cpd. with cpd. contg. amino and opt. imino and/or hydroxyl gps., and crosslinking the obtd. polycondensate

TEIJIN KK 31.01.78-JA-008924

A88 J01 (11.08.79) B01d-13 C08j-07/12

Permselective membranes are prepd. by reacting a dihalide of formula $X\text{-}CH_2.CH(R)\{O.CH_2.CH(R)\}_mX$ (A) (where R is H or methyl, X is halogen and m is an integer of 1 to 10) with amino-, imino- and/or hydroxyl gps. of a cpd. of < 100C contg. > 2 amino gps. and/or cpd. of < 100C contg. ≥ 1 amino gp. and ≥ 1 imino- and/or hydroxyl gps., and crosslinking the resulting membrane using a polyfunctional cpd. which can react with amino-, imino-

and/or hydroxyl gps. remaining in the polycondensated substance.

The semipermeable membrane obtd. exhibits excellent desalting efficiency and permeability to water, and has a good resistance to hydrolysis and compression. 31. 1. 78 as 008924 (7pp96)

GNZE ★ D15 69018B/38 ★J5 4102-294

Reverse osmosis or ultrafiltration of waste water - using sawdust as drying medium, which is then dried for reuse

GUNZE KK 28.12.77-JA-158394

(11.08.79) B01d-13

The conc. water is mixed with sawdust in a mixer to increase the water content of the sawdust by 20-80%. The dust is spread in a dry chamber and dried by heating with sunshine and other heat to a water content of 20%. The dry sawdust is then reused.

The method reduces the amt. of energy required and the amt. of sludge produced. 28. 12. 77 as 158394 (2pp26)

MITU ★ D15 69078B/38 ★J5 4102-390

Partially hydrolysed acrylamide polymer prodn. - adding sodium pyrosulphite to remove ammonia odour and also ammonium thiocyanate, potassium iodide and/or oxalic acid

MITSUBISHI CHEM IND KK 31.01.78-JA-009546

A14 (11.08.79) C08f-08/12

In the prepn. of partially hydrolysed acrylamide type polymers where a water-contg. gel polymer obtd. by polymerising an acrylamide-contg. aq. soln. is granulated and the granules are partially hydrolysed with a caustic alkali or an aq. soln. of an alkali carbonate, followed by drying, the improvement comprises adding to the polymer dried to a water content of $\leqslant 20$ wt.%, 1-15 wt.% of sodium pyrosulphite and 0.5-10 wt.% of $\geqslant 1$ of ammonium thiocyanate, potassium iodide and oxalic acid based on the dried polymer.

Addn. of sodium pyrosulphite alone separately proposed is effective to remove the ammonia odour of the polymer but tends to slightly reduce coagulating ability of the polymer when used as coagulant in tap water. In the invention, this disadvantage can be eliminated. 31. 1. 78 as 009546 (3pp140)

MITU ★ D15 69079B/38 ★J5 4102-391

Partially hydrolysed acrylamide polymers, used as coagulants - prepd. with addn. of sodium di:hydrogen:phosphate or calcium chloride to remove the smell of ammonia

MITSUBISHI CHEM IND KK 31.01.78-JA-009547

A14 (11.08.79) C08f-08/12

In the prepn. of partially hydrolysed acrylamide type polymers useful as coagulants, a water-contg. gel polymer obtd. by polymerising an acrylamide-contg. aq. soln. is granulated and the granules are partially hydrolysed with a caustic alkali or an aq. soln. of an alkali carbonate, followed by drying. The improvement comprises adding, to the polymer dried to a water content of $\leqslant 20$ wt.%, 1-15 wt.% of sodium dihydrogenphosphate and/or calcium chloride based on the dried polymer.

The odour of ammonia remaining in the polymer can easily be removed without reducing the coagulating ability of the polymer. The addn. is generally conducted after completion of the drying, but, of course, be effected during the drying after the water content of the polymer has been reduced to $\leqslant$ 20 wt.%. 31. 1. 78 as 009547(3pp140)

Removal of phosphate from sewage, industrial effluent, etc. - by passing through fluidised phosphate ore in presence of calcium ions

EBARA INFILCO KK 08.01.78-JA-009600

E11 (E36) (14.08.79) C02b-01/23 C02c-05/02

Removal of phosphates, e.g. orthophosphates, polyphosphates and organic phosphates, from liquors, e.g. sewage, polluted water, industrial effluents, comprises passing the liquor through a tower packed with phosphate ore contg. Ca phosphate. The improvement comprises passing the liquor through in the presence of Ca ions, e.g. $CaCl_2$ and $Ca(OH)_2$ while maintaining its pH at 6.0-11.0 under such a flow rate that the phosphate ore is maintained in fluidised state, so that the soluble phosphates in the liquor are deposited on the surface of the phosphate ore in the form of Ca hydroxy apatite crystals $[Ca_5(OH)(PO_4)_3]$.

It is possible to remove phosphates from liquors having high phosphate concn. and it is easy to carry out sepn. and dewatering of the phosphate ore. The amt. of the Ca cpd. (Ca ion) added is in the molar ratio Ca/PO_4 of 1.0 to 5.0 w.r.t. the amt. of soluble phosphates contained in the liquor to be treated. 8. 1. 78 as 009600 (5pp34)

SI ★ D15 69779B/38 ★US 4167-479
rificn. of waste waters - by simultaneous chemical and biological
action using minerals contg. surface microorganisms
BESIK F 24.03.78-US-889880 (08.10.76-US-730815)
(11.09.79) C02c-01/04

urification process is described for the removal of bio-
egradable suspended and dissolved organic solids, N-
pds., and phosphates from contaminated waters by
imultaneous biological and chemical reactions at pH 8.

One or more finely divided minerals (I) (particle size
50 mesh US Standard Screen) are added infrequently to
ive (I) concn. 10-200 g/l; in the reactor a mixed micro-
ial population present in the waste waters is retained
nd grown on the surfaces of retained (I). Using forced
ir the contaminated H_2O, (I), and microorganisms (II)
re circulated through the reactor system which consists
f ≮2 zones in which biological oxidn., biological nitri-
ication, and biological denitrification each occur simul-
aneously with the chemical reactions in the system, and
n which the concn. of free metal ions of (I) is at the (I)
olubility levels.

The circulation involves passing the H_2O downwards
hrough zone 1 to contact it with (I)-(II), while the dis-
solved O_2 concn. in the zone's upstream region is kept at
1-2 mg/l (to support oxidn. of biodegradable solids to
CO_2, and oxidn. of N-cpds. to nitrite and nitrate), and contact time is controlled so that the biological reactions reduce the dissolved O_2 concn. in the downstream region to < 1 mg/l to induce biological denitrification. Some of the H_2O and (I)-(II) is passed upwards through zone 2 (sludge settling zone) where the biological denitrification (for reducing nitrite and nitrate concn.) is contd. to reduce dissolved O_2 concn. to < 0.5mg/l. The upward rate of flow of H_2O in zone 2 is controlled to provide a quiescent region which allows most of the active (I)-(II) to separate from the H_2O prior to discharge. Simultaneously in zones 1 and 2 most of the phosphate ions present are pptd. by reaction with the metal ions dissociated from (I) at pH 6-8. The reactor effluent from the quiescent region of zone 2 which contains suspended solids is transferred to a reactor-clarifier which has 2 vertical chambers (2nd chamber connected to the lower end of the 1st chamber). Liq. is passed downwards through the 1st chamber, and then upwards through the 2nd chamber by withdrawing and aerating a portion of active (I)-(II) from the 2nd chamber and returning it to the upstream end of the 1st chamber so that the dissolved O_2 concn. in the 1st chamber is ca.1mg/l. The upward flow in the 2nd chamber is sufficient to develop a fluidised bed of (I)-(II) from which the (I)-(II) withdrawal is made. The biological and chemical reactions are completed in the 2 chambers, suspended solids are sepd., and clarified H_2O is discharged.

(I) have surfaces which attract (II) and adsorb organic cpds. and phosphate; are non-toxic to (II); have limited solubility in the waste H_2O; and are suitably bauxite, cerussite, clinoptilolite, corundum, diaspore, gibbsite, halloysite, hematite, kyanite, millerite, or mixts. 24.3.78 as 889880 (14pp478).

Removal of (heavy) metals from aqs. solns - by treatment with an ion exchanger in the presence of a polyamine (BE170976)
LEUVEN RES & DEV 19.03.75-NL-003293
*J01 (11.09.79) *DT2610-281 B01d-15/04 C02b-01/16 C02c-05/02*

Metals are removed from an aq. soln. contg. ions of ≥ 1 dissolved metal which is capable of forming stable cationic complexes with polyamines, by adding a polyamine to the soln. in ≥ equimolar amts. w.r.t. the metal to form a stable cationic complex.

The soln. of the first step is then contacted with a cation exchanger to adsorb the complex from the soln; the cation exchanger is then sepd. from the aq. soln. The polyamine is ethylenediamine, propylenediamine, triaminotriethylamine, diethylenetriamine, triethylenetetramine, tetraethylenepentamine or tetra-2-aminoethylethylenediamine. The cation exchanger is a synthetic or natural tectosilicate or phyllosilicate in amt. 3-30 gms. of cation exchanger per gm. of metal ion to be removed.

The process is esp. used to remove metals from waste water which are toxic or detrimental to the environment, such as Hg, Cd, Cu, Zn, Ag or Ni. 22.7.77 as 818060 (+10.3.76-US-665522) (6pp931).

Article for radioactive waste transportation and storage - has a solid body of polymerised urea formaldehyde resin
NUCLEAR ENGG CO 07.06.76-US-693419 (24.01.72-US-220449)
A81 K07 (A21) (11.09.79) G21f-09/16

An article for safe transportation and storage of radioactive waste material contg. free water comprises a solid body of polymerised urea-formaldehyde resin in which water and the radioactive components of the waste material are distributed in controlled proportions to provide a desired low hazard radiation classification of the body. Pref. the body also includes a non-radioactive filler for further increasing the volume of the body so as to act as a shield and alternate radiation levels from the body. The body may be encased in a disposable protective container.

The waste material is esp. contaminated water from the cooling loop of an atomic reactor (which usually contains radioactive Ni and Co isotope) and the article is of relatively light wt. to facilitate shipping. The parent patent (18042Y/10) described the prodn. of the article. 7.6.76 as 693419 Div. ex 4010108 (+29.11.73-US-420008) (5pp990).

A broth medium is prepd. for the detection of pseudomonas aerugiriosa comprising a nutrient source, a nitrate salt to assist in cell growth and pigment prodn. in the condition of limited oxygen, and cetyl trimethylammonium bromide to inhibit gram-negative organisms.

The presence of p.aeruginosa is indicated by the metabolic formation of a detectible pigment or the prodn. of visible biomass. The nutrient source is a mixt. of peptones including a peptone derived from casein by the pancreatic digestion and a papaic digest of soya meal high in vitamins.

Process is esp. used for the detection of P.aeruginosa in urine, which is a reliable indicator of an infection in the urinary tract. 8.3.77 as 009751 (3pp931)

Clinical inspection of heart and liver disease - by activity measurement of glutamic acid oxaloacetic acid amino grp transferase

TOYO SPINNING KK 14.12.74-JA-143687

*B04 R16 (24.08.79) *J51069-692 G01n-31/14 G01n-33/16*

Improvement in method of measuring activity of glutamic acid oxaloacetic acid amino gp. transferase (GOT) important to clinical inspection of liver, heart disease, involves using asparagic acid and α-ketoglutaric acid as substrate, upon wich GOT acts to produce oxaloacetic acid and glutamic acid.

Resulting oxaloacetic acid is heated with di- or trivalent metal ion (e.g., Ni^{2+}, Zn^{2+}, Fe^{3+}, Al^{3+}, etc.) in the presence of protein (e.g. aq. soln. composite protein such as nuclear protein, etc. or water-soluble simple pro-tein such as blood serum protein, etc.), to form pyruvic acid.

The activity of the enzyme is found by estimating this pyruvic acid. Method gives good reproducible precise results of Leitmann-Frankel method. Same reagent reagent can be employed for activity determn. of glutamic acid pyruvic acid amino gp. transferase. 14.12.74 as 143687 G01n-33/16; 31/14 (24.8.79) TOYO SPINNING KK (5pp) (J5 1069692)

TOYM D16 58880X/31 =J7 9024-878

Glutamic acid oxaloacetic acid amino gp transferase activity - measured by producing pyruvic acid and determining this

TOYO SPINNING KK 14.12.74-JA-143688

*R16 (24.08.79) *J51070-695 G01n-31/14 G01n-33/16*

A novel method for determn. of glutamic acid oxaloacetic acid amino gp. transferase (GOT), is provided. Asparagic acid and α-ketoglutatic acid are used as substrate, with which GOT is acted to give oxaloacetic acid and glutamic acid. The resulting oxaloacetic acid is acted on by oxaloacetic acid decarbonation enzyme, and decarbonated to form pyruvic acid. The amt. of pyruvic acid is determined. Oxaloacetic acid is turned to pyruvic acid in the above reaction.

In the absence of oxaloacetic decarbonation enayme in the reaction system, only 60% of oxaloacetic acid turns to pyruvic acid. The use of pyruvic acid as standard matl. is suitable from theoretical and practical standpoints. Limitation of amt. of substrate is not necessary, and determn. of activities of GOT is possible without diluting the reagent. 14.12.74 as 143688 G01n-33/16; 31/44 (24.8.79) TOYO SPINNING KK (5pp) (J5 1070695)

**lcohol prodn. fermentation control - using pressurised
rmentation gas for activating pulsators**
FERMENTATION PROD 21.07.77-SU-508937
(15.12.78) C12c-11/08

ntensified fermentation and increased resistance to infec-
ion of the medium in alcohol prodn. are ensured by gas
ulsation with pressure 20-30% above the static level. The
ulsator amplitude is 10-20mm, frequency is 100-150
min^{-1}, and the period of pulsations is 15-20 min.

The change over to conditions of fermentation without
ulsations is carried out by valve switching. The pulsed
gas is exhausted from the pulsator to the atmospheric
pipeline which is connected to a user point. The gas from
the fermenters is collected into a common pipe where
pressure is maintained above the fermenters pressure for
activating the pulsators.

Selection of lactic flora streptococci for dairy industry - by determining their lipolytic properties with respect to polyoxyethylene-sorbitol mono:palmitate
ALTAI DAIRY PROD 11.03.77-SU-462879
(D13) (15.12.78) A23c-19/02 C12k-03

Selection of lactic acid streptococci, for use in the dairy industry, is carried out by cultivating the streptococci in a nutrient medium contg. hydrolysed milk, water and tvin; transferring the culture(or the culture liquid) to a developing medium contg. agar-agar, $CaCl_2$ and the test substance; and cultivating at the optimal temp. in CO_2 atmos., for 8-10 days.

The method is improved by using milk hydrolysed with pancreatin and, as a test substance, tvin 40(polyoxyethylenesorbitol monopalmitate). Strains producing an opaque halo in the agar medium around the colonies exert lipolytic activity and hence, are unsuitable for use in the butter prodn. Strains, which do not produce such a halo, do not possess lipolytic properties and are unsuitable for cheese prodn.

Solar-contg. vegetable hydrolysate and cellulose pulp processing waste - treated with pyrolysed active mud as neutralising agent, for use in biochemical alcohol and yeast biomass mfr.

ARKHANGELSK FORESTR 18.07.77-SU-509962
F09 (15.12.78) C13k-01/04

Neutralisation of sugar-contg. hydrolysates of vegetable substances and spent sulphite lyes, prior to biochemical processing to produce alcohol and yeasts, is carried out using a reactant preliminarily subjected to pyrolysis. This method is improved by using as a neutralisation, reactant active mud subjected to pyrolysis, pref. at 800-950°C for 10-60 min.

By this method the quality of the neutralisation agent is improved and the cost is reduced. The technology is simplified because of the use of the dry reactant.

Gelfand, E.D., Krivulin, P.A., Bogdanovich, N.I., et al Bul.46/15.12.78.8.7.77.as 509962(2pp70).

Quantitative determination of pectin - by extn. with water and photometry using sodium hydroxide for colour forming, used in microbiology, food, textile, printing and medicine

FRIDMAN T F 10.03.77-SU-461062
B04 J04 R16 (D13) (18.12.78) G01n-33/02

The method involves treatment of an aq. soln. of pectin (I) with an alkaline agent, pref. sodium hydroxide (II) soln. acting as a colouring agent. The optical density of the coloured soln. is then measured at pH 11-12 at λ = 375-385nm. The amt. of (I) is found in the usual way from a previously prepd. calibration curve.

The method is simple, ensures higher accuracy(1.5% as compared with 3% by the existing method) and is more rapid(30 mins; 5 hrs. by the existing method). Standard deviation is 1± 1.5%.

The method ensures better quality biochemical prepn. based on (I); this is especially important in prepn. of pectolytic enzymes.

Maintenance-state culture of single-cell microorganisms - to fix nitrogen, and give effluents contg. useful metabolites etc.

UNIV NEW HAMPSHIRE 13.07.77-US-815079

(11.09.79) C12b-01 C12d-01 C12d-03

Method of growing and maintaining a culture of single-celled microorganisms (I) so that >90% of the available energy source is used for maintenance energy is as follows (a) a liq. nutrient medium (kept in a closed system consisting of a vessel connected to a filter so that a cell-free filtrate contg. metabolites can be continuously withdrawn from the system) is seeded with (I) cells which are then cultured; (b) as the cell mass is increasing additional nutrient medium is added at a vol. rate (F_R) such that $F_R \times S_R$ is constant (S_R is energy substrate concn.), and the cells are cultured until the rate of increase of mass is reduced to a min., and the cell concn. (X_m) is given by equation (A), the S_F (concn. of energy source in the system) is allowed to decrease to zero; (c) a portion of the medium is filtered and is then transferred at a rate F_S to a receiver.

$$X_m = \frac{F_R}{V_R}\left[\frac{S_R - (S_F + S_A)}{M_c}\right] \qquad (A)$$

In (A), X_m = cell mass/unit fluid vol.; V_F = fluid vol. of system; S_A = amt. of energy source assimilated into cells/unit fluid vol.; M_c = coefficient relating rate of use of energy source for maintenance energy to cell mass.

Method may be used to produce cell mass from a C energy source and also to completely metabolise substrates, both at max. efficiency, and is esp. useful in waste treatment systems. In addn., the system may be used to fix atmos. N_2, affording effluents contg. useful metabolites (e.g. 2,3-butanediol) which may be immediately and completely sepd. from the rest of the system. 13.7.77 as 815079 (8pp478).

Solid or aq. solvent for extracting cellulose - from cellulosic waste, contains metal chelate former, metal and caustic swelling agent
PURDUE RESEARCH FOUNDATI 08.03.78-US-884477
F09 (13.09.79) C12d-13/02 C13k-01/02 D21c-05

Non-toxic cellulose solvent compsn., present as a dry powder, consists of a metal chelate-former, a metal and a caustic swelling agent, and is referred to as 'CMCS', signifying 'chelating metal caustic swelling'.

A solvent compsn. for dissolving and extracting cellulose from cellulosic materials is claimed, contg. (1) a swelling agent, e.g. NaOH, to set a high or low pH, to loosen the cellulose structure from cellulosic material coming in contact with the solvent, (2) a metallic cpd., esp. $FeCl_3$, having access to the cellulose structure, (3) a protective agent to retain the metal in soln., esp. tartaric- or gluconic acid, and (4) a stabiliser, esp. $NaSO_3$ to stabilise the solvent compsn.

The solvent is used for processing waste materials, e.g. straw, to recover cellulose which can be hydrolysed to glucose. The solvent can be recovered quantitatively and recycled. The starting material need not be dried before treatment with solvent. Use of a solid solvent saves operating costs. 6.3.79 as 908992 (20pp200)

Machine to cut flexible sheets of leather, plastic, textiles etc. - with manually steered high pressure fluid cutting nozzle

BERTIN & CIE 06.12.77-FR-036655

A31 F07 P62 (10.08.79) B26f-01/26 C14b-05

Machine uses a high speed jet of fluid, usually water, to cut through the sheet. The sheet to be cut is laid flat upon a horizontal work table made of porous material through which the fluid can drain. Above and very close to the sheet on the table is the outlet of a nozzle piped to a source of high pressure fluid.

Immediately beneath the table and directly opposite to the nozzle outlet is a cup to catch fluid and return it to the source. Nozzle and cup are fixed to a common support which can be moved horizontally relative to the work table.

The entire area of the table is positioned over a tank which collects any fluid escaping from the cup. The tank drains back to the source. The nozzle and cup support is pref. fitted with a guiding handle and mounted on radial arm pivoted to be swung in a horizontal plane.

Used for cutting sheet material such as skins, leather, plastic, textiles, paper, rubber. Employable partic. in a tawery for dressing and cutting light skins, e.g. to remove flaws. Process eliminates manual dressing with scissors. The machine is quiet in operation, easy to load and unload and safe for the operator. 6.12.77 as 036655 (10pp).

Cellulose acetate foam cigarette filter rod - prod. by extrusion with blowing agent under controlled temp. conditions

CELANESE CORP 13.03.78-US-886201

A88 P15 (A11 A32) (19.09.79) A24c-05/50 A24d B01d B29d-27 C08j

A plasticised open cell foamed cellulose acetate filter rod is prepd. by extruding a melt free of entrained air and contg. cellulose acetate, a plasticiser, a blowing agent which is at least a partial solvent for the cellulose acetate, and a nucleating agent.

The process is carried out in six zones:- (i) a polymer feed zone, where cellulose acetate flake is kept at -20 to 100°C, (ii) a melting zone at 100-240°C, (iii) a high pressure high shear zone where blowing agent is added, (iv) a fourth zone at a lower temp. than the third, (v) an extrusion die zone kept at 180-270°C, and (vi) a sixth zone kept at a temp. from 45° up to within 5°C of the glass-rubber transition temp. of the extrudate. Zones 2-4 are contained in a screw extruder.

The rods are useful as cigarette filters, The foam is low density, the cells being bridged by fibre-like elements The surface area is high, and pressure drop is low. The plasticiser is uniformly distributed, improving phenol removal from smoke. 13.3.79 as 7008813 (12pp955)

Undercoat for lipstick - consists of water-soluble high molecular cpd., poly:hydric alcohol, wetting agent and water

KOBAYASHI KOSEI KK 26.01.78-JA-007661

A96 (10.08.79) A61k-07/02

The undercoat is prepd. from (a) a water-soluble high molecular cpd. (I), (b) a polyhydric alcohol (II), (c) a wetting agent (III) and (d) water.

The material (a) gives an emollient effect to the lips, (b) prevents oozing of lipstick and (c) prevents dyeing of the lips with the tar pigment contained in lipstick.

(I) is e.g. gum arabic, algal colloid, sodium polyacrylate, PVA, PVP, tragacanth gum, Irish moth, hydroxypropylcellulose, hydroxyethylcellulose, Na CMC and/or methylcellulose, (II) is a sugar such as sucrose, glucose, etc., glycerin, sorbitol, mannitol, propyleneglycol, 1,3-butyleneglycol, dipropyleneglycol and/or polyethyleneglycol. (III) is a water-soluble silicon, water-soluble lanolin and/or a surfactant having a HLB > 10.0. Amts. of (a), (b) and (c) are 0.4-12 w/w%, 10-20 w/w% and 0.1-1.0 w/w% respectively, w.r.t. prod. 26. 1. 78 as 007661 (4pp5)

Perfume compsn. - contains mixt. of maltol; chelating agent, e.g. poly: phosphate:and opt. dispersing or coating agent

SAN EI CHEM IND KK 27.01.78-JA-008696

E13 (10.08.79) A61k-07/46

The perfume compsn. contains (a) a homogeneous mixt. of maltol and a chelating agent such as polyphosphate or (b) a homogeneous mixt. of maltol, dispersing or coating agent such as gum arabic, etc. and chelating agent such as polyphosphate, etc., as the major component.

By using maltol together with the chelating agent, colouration with iron ions can be prevented and, in the presence of a dispersing or coating agent, the chelating agent is excellently dispersed to enhance prevention of the colouration of maltol.

As maltol, maltol, ethylmaltol, etc. can be used. Practically, the homogeneous mixt. can be prepd. either by mixing powdery maltol and powdery chelating agent or by adding maltol to an aq. soln. of chelating agent and spray-drying the soln. 27. 1. 78 as 008696 (2pp5)

AJM- ★ D22 68510B/38 ★EP ---4-239
terilising and vacuum sealing rack - esp. for linen in plastic bags, as auxiliary racks to speed up operation
MAJ SARL 13.03.78-FR-007107
P34 Q31 (19.09.79) A61l-03/02 B65b-31/02 B65b-51/14
D/S: E(BE, CH, DT, GB, IT, LU, NL, SW).

An arrangement for maintaining under vacuum, articles, esp. linen, in plastic wrappings, conditioned and sterilised in an autoclave, includes at least one shelving rack supporting a number of parallel bars. There are a number of packages in the form of bags of plastic material, impermeable to the air, and open at one end. These are supported in the rack in such a way that the open end of each package is located between two adjacent bars of the number supported by the rack. Elements are fixed to the parallel bars by which the bag open ends are compression sealed.

The parallel bars are fixed securely to the rack so as to form slots of a predetermined size between the compressing and sealing elements, the slots being open at at least one end. The packages are supported by at least one auxiliary rack, with six rectangular faces. This can be introduced into the main rack in a direction parallel to the lengthwise direction of the slots from the side where their ends are open.

The design eliminates the delay of 15 to 20 mins. necessary with similar installations to allow for the cooling down of the packages, before they can be handled, without the expense of two separate main racks and their expensive equipment. The simplicity of the present design reduces considerably the maintenance work necessary. The packages are laid flat so that the folded linen inside does not collapse on itself, and the packages are easily stacked. When the main rack is withdrawn from the autoclave, the auxiliary racks can be replaced by others already loaded with packages for treatment.
7.3.79 as 400146 (15pp1014).

Disinfectant compsn. contg. polymer solvent - forming film on surface thereby increasing effectiveness
SALKIN N 26.02.76-FR-005396
*A97 P34 (19.09.79) *BE-851-506 A61l-13*

Liq. disinfecting compsn. comprises an aq. or water-dispersible polar solvent, ⩾1 film-forming polymer soluble in the solvent and a disinfectant. The mixt. is capable after application to a substrate of drying under ambient atmospheric conditions, to form an air-permeable and hydroscopic film from which the disinfectant is gradually released.

Pref. solvent is water and/or an alcohol, the polymer is PVP (copolymer) and the disinfectant is chlorohexidine. Specifically the copolymer is obtd. from vinyl pyrrolidone and vinyl acetate. Pref. the compsn. also contains wetting agent, plasticiser, buffer, perfume etc.

The compsn. can be used for cleaning exposed surfaces in the foodstuffs industry, in the plucking of fowls etc. 12.2.77 as 007373 (5pp924)

LIOC ★ D22 68817B/38 ★J5 4101-425

Insecticide for use on clothes - comprises acetoxime as major component

LION DENTIFRICE KK 24.01.78-JA-006400

C03 E16 F06 (10.08.79) A01n-09/20

Insecticide for clothes contains as major component acetoxime. The active cpd. shows high controlling effect to harmful insects (e.g. larvae) of clothes. It has an effect as high as p-dichlorobenzene. It does not etch or plasticise plastics and can be used safely. No trouble is caused even if it is used in combination with other active components. Addition of naphthalene brings about duration of the effect. The active cpd. does not contaminate or discolour clothes. 24.1.78 as 006400 (3pp108)

FUSO- ★ D22 68855B/38 ★J5 4101-764

Deodorisation of gas contg. hydrogen sulphide, amine or fatty acid - by mixing with ozone at high temp. and high humidity then contacting with hydrogen peroxide spray

FUSO KK 30.01.78-JA-008291

E36 (10.08.79) B01d-53/34

Gas which contains H_2S, amine(s) and/or fatty acid(s) as malodorous component(s) is mixed with ozone under conditions of high temp. and high humidity and the resulting gas mixt. is contacted with sprayed hydrogen peroxide to effect deodorisation.

The malodorous component(s) of the gas, can be decomposed and removed at high efficiency and at low cost. The amt. of hydrogen peroxide and ozone used is very small (the concn. of H_2O_2 is 0.03-3% and the amt. of the O_3 w.r.t. the gas being treated is pref. 0.5-2 ppm) and after reaction with the gas almost all the hydrogen peroxide is decomposed, thus secondary pollution or industrial waste treatment problems can be avoided. 30.1.78 as 008291 (3pp55)

HASH/ ★ D22 68856B/38 ★J5 4101-765

Removing foul smelling odour from air - by treating with fused paraffin liq. to remove solvents and then with non-(hypo)chlorite oxidising agent

HASHIDA H 28.01.78-JA-008498

P34 (10.08.79) A61l-09/ B01d-53*

Air with foul-smell contg. an organic solvent vapour, is first contacted with fused paraffin liquid in order to remove the organic solvent from the air, and the treated air is then contacted with an aq. soln. contg. an oxidising agent except a chlorite or a hypochlorite.

Treatment is used for purifying air having foul-smell which is produced e.g. in a waste water treatment process or various factories, etc. The causes of the foul-smell are various (in)organic cpds. such as mercaptan, amines, etc. These can be completely decomposed and absorbed by using a combination of easily available oxidising agents such as a permanganate, a dichromate etc. 28.1.78 as 008498 (3pp55)

ENDO/ ★ D22 68866B/38 ★J5 4101-782

Exothermic chemical compsn. for hot compress - comprises anhydrous calcium chloride, sodium hydroxide and chemical relaxation agent, e.g. starch

ENDOH R 30.01.78-JA-009011

E33 (E34) (10.08 79) C09k-05

Compsn. comprises a mixt. of 1 pt. wt. of anhydrous calcium chloride, 0.2-2 pt. wt. of sodium hydroxide and an exothermic relaxation material (I) such as starch (at a ratio of mixt./relaxation material of 1 pt. wt./0.1-1 pt. wt.)

By adding (I) the heat emission can be controlled, the heat emission time can be extended, and the total amt. of the exothermic agent can be increased, thus the quality as a hot compress can be improved. 30.1.78 as 009011 (2pp [illegible]

N-Acetyl epsilon-aminocaproic acid prodn. - by hydrolysing N-acetyl-caprolactam in boiling water with subsequent freezing, for use in medicine as wound and bone fracture healing agent

KHARK PHARM CHEM 18.07.77-SU-507583

E16 (28.12.78) A61k-31/19 C07c-101/04

N-acetyl-ε-amino-caproic acid, which is used as a base in preparations promoting the healing of wounds and fractured bones, is produced by hydrolysis of N-acetyl-ε-caprolactam. The yield is increased by effecting the hydrolysis in boiling water for e.g. 5h. and then keeping the reaction mass at -10° to -25°C for e.g. 48h. The product is subsequently isolated by filtration.

By this method high-purity product is obtd. (purity $\geq$ 98.5%) so that there is no need for recrystallisation. The optimal ratio lactam:water is 1:1 to 1:3. The yield is 28.8-30.9% theor. The product is dried at $\leq$ 60°C. The m.pt. of the title cpd. is 104-106°C.

Yasnitskii, B.G., Dolberg, E.B., Spivak, A.L., et al Bul.47/25.12.78.18.7.77.as507583(2pp70).

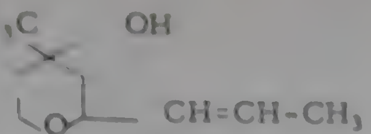
4-Methyl-2-propenyl-tetra:hydro-pyran-4-ol prepn. - by condensing 2-methyl-butenol with crotonaldehyde in aq. mineral acid, used i perfumes and cosmetics

AS ARMN ORG CHEM 24 02 77 SU 455528

E13 (28 12 78) C07d 309 10 C11b-09

4-Methyl-2-propenyl-tetrahydro-pyranol-4(I) is of the formula (I)



(I)

The formation of (I) involves condensn. of 2-methyl-buten-1-01-4(II) with crotonaldehyde(III). The reaction is carried out by heating the reagents in an aq. medium in presence of inorganic acid catalyst, pref. H_2SO_4 or H_3PO_4 or ion-exchange resins in H-form.

The condensn. is carried out for 4-6 hrs. at 50-60°C, using the starting reagents pref. in the equimolar ratio. This prevents formation of dihydropyrans. The acids are pref. of 20-30% strength in the amt. of 10-30 wt. % of the starting reagents. Use of less dil. acids as given is not recommended.

The method offers advantage of using cheap and easily available starting reagents. The cpd. is described as new. Gevorkyan, A. A., Kazaryan, P.I., Filatova, G.G., et al Bul. 47/25.12.78. 24.2.77. as455528(2pp48).

This is followed by or used simultaneously with a powdered Ca or Mg soap (0.3-15 wt.%), of 16-22 C fatty acids, with particle size < 100 µm. Pref. perfumes are linaloaol, terpinol, geraniol, eugenol, $PhCH_2CH_2OH$ and/or $PhCH_2OH$. 4.7.74 as 432523 (6pp047)

PROC ★ D25 68458B/38 ★EP ---4-108

Prodn. of intimate mixt. of N-based cationic surfactant - and water-soluble dispersible cpd., by quaternising tert. amine in liq. medium which constitutes cpd., using volatile quaternisation agent

PROCTER & GAMBLE CO 07.03.78-GB-008989 (06.03.78-GB-008778)
A97 E19 (19.09.79) C07c-85/02 C11d-01/62

D/S: E(BE, CH, DT, FR, GB, IT, NL).

Prodn. of an intimate mixt. of a nitrogen-based cationic surfactant and a water-soluble or -dispersible cpd. comprises (i) quaternising a tert. amine to form a cationic surfactant in a liq. reaction medium comprising a water-soluble or -dispersible cpd. of mol. wt. > 240, one of the quaternisation reactants being volatile relative to the other reactant(s) and having a b.pt. (atmos.) of ≤200°C, and the volatile reactant being present in stoichiometric excess; and (ii) treating the mixt. at $\ngtr$ 200°C to remove any unreacted volatile reactant and leave an intimate mixture in which the ratio of organic reaction medium to cationic surfactant is 50-1:1-2.

The mixt. can be used either in its own right for delivering a cationic surfactant in a variety of physical forms (e.g. as a granule, chip, flake, noodle or agglomerate), or as an adjunct to conventional granular detergents. Most pref. it is used as a source of cationic surfactant in the sheet-type laundry additive product described in EP appln. no. 200051/78.

By using a reaction medium which is itself a component of the final prod., but which is liquid under the conditions employed for quaternisation, there can be obtd. the desired cationic surfactant as a finely divided dispersion (or in some cases a soln.) without the need to use solvents which require recovery or disposal. The necessity of isolating the surfactant and separately adding it to the product is avoided. The process is inexpensive and commercially attractive.

Compsn. for hard surface cleaning of e.g. ovens - contains alkanolamine, water-insolubilised polysaccharide and water

DRACKETT CO 31.08.77-US-829374

A97 E16 (A11) (11.09.79) C11d-07/22

Compsn. for hard surface cleaning contains $\nless$ 5wt.% of an alkanolamine (I); 0.3-1.5wt.% of an H_2O-insolubilised polysaccharide (II), and $\ngtr$ 93.5wt.% H_2O. (I) is mono-, di-, or triethanolamine or mixts. (II) has OH and CO_2H gps., and the ratio range of the free acid form to salt form of the CO_2H gps. is 0.07-3:1.

Pref. (II) are starch, natural gums, esters and ethers of starch or natural gums or cellulose, or mixts.; esp. a carboxyalkyl cellulose ether (e.g. Na CMC) which has been cured as described in US3379720; partic. compsns. pref. contain 0.6-1.0% by wt. of (II).

Compsn. readily penetrates burned-on deposits of food and other organics on ovens, pots etc., but does not form a hard outer layer on the deposit, and is not as strongly alkaline as conc. caustic alkali. 31.8.77 as 829374 (4pp478).

FARH D25 88709V/52 =US 4167-6

Surface-active fluoro-sulphosuccinates - derived from maleic anh dride and perfluoroalkyl alcohols, useful as wetting agents or dispersants

HOECHST AG 09.06.73-DT-329660

*E19 (11.09.79) *BE-816-122 C09g-01/08*

Fluorinated sulphosuccinates of formula R-O-CO-CH_2-C (SO_3M)-COOR^1 are new. In (I) R is of formula Rf-(CH_2)m-(OCH_2CH_2)n (where Rf is straight chain or terminal Me- branched 2-8C perfluoroalkyl, m = 1-4 and n = 0-3). M is H, alkali metal, NH_4, mono, di or tri ethanolammonium, glycinium, taurinium, N-methyltaurinium; R^1 is as R or as M.

(I) are useful as surfactants, esp. wetting agents, levelling agents in wax emulsions or as dispersants. A specific cpd. is (I) where Rf is n-C_6F_{13}, n = 0, m = 2, M is Na and R^1 is Na. 17.2.78 as 878881 (+6.6.74, 12.2.76 -US-477321, 657549) (6pp964).

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

Not in Basic Abstracts Journal

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

LOBO/ ★ D11 B/39 ★BR 7801-139
Gas oven for roasting cassava
LOBO A R 18.01.78-BR-001139
(11.09.79) A21b-01/28

RITT/ ★ D11 69993B/39 ★DL -136-341
Baking flour mixing system - merging pneumatically conveyed doses in common mixing silo
RITTER G 26.05.78-DL-204515
(04.07.79) B01f-05

Two or more grades of different flour are mixed in the bakery industry by extracting each grade from its silo separately at a rate which corresponds to the desired mixing ratio. These separate supplies are merged in a mixing silo where the turbulence caused by the merging streams creates a homogeneous flour mixture.

Anotherpneumatic conveyor line takes the flour from the mixing silo to the day batch silo. This saves the high power consumption for mixing screws and the supply interruptions to weigh the charges It produces flour of very homogeneous quality. 26.5.78 as 204515 (4pp39)

QPPP ★ D11 70794B/39 ★J5 4105-249
Stable food compsns. - comprises shaped alpha-lysed starchy food immersed in soln. of dextrin or dextrin alcohol
Q.P. CORP 02.02.78-JA-010782
(18.08.79) A23l-01/10

The compsn. consists of (a) α-lysed starchy food of definite shape and (b) a soln. of dextrin or dextrin alcohol, in which the starchy food is immersed. Softening and integration of starchy food such as rice, macaroni, spaghetti, Japanese noodles, buckwheat noodles, etc. due to absorption of water and swelling, can be suppressed and the α-lysed starchy food can be preserved for a long time without change in form, texture, taste and flavour.

Dextrin is used at a concn. of 5-30 w/w% and dextrin alcohol is used at a concn. of 5-35 w/w% depending on the desired water content of the α-lysed starchy food. 2.2.78 as 010782 (5pp5)

HIRA/ ★ D11 70795B/39 ★J5 4105-255
Bread mfr. using flour and rice powder - with hot water extract of yeast and emulsifier(s) added to dough to improve quality
HIRANUMA Y 03.02.78-JA-010529
(18.08.79) A21d-02/36

The method comprises fermenting, kneading the main dough, fermenting the main dough, finishing, roasting and burning. The dough is prepd. from flour 95-80 w/w%, rice powder 5-20 w/w%, yeast, water, etc. The dough is combined with 0.3-2.5 w/w% of the hot water extract of yeast and 0.2-1.0 w/w% of $\geqslant 1$ emulsifier selected from glycerin fatty acid ester, sucrose fatty acid ester and sorbitan fatty acid ester.

Excellent bread, can be prepared without using viscosity-increasing agent such as gluton, natural gum etc. The prepd. bread is voluminous and of excellent colour, gloss, form, texture, taste and flavour, tissue, etc. 3.2.78 as 010529 (5pp5)

GOLD/ ★ D11 71174B/39 ★SU -639-503
Bread-baking oven with steam-moistening attachment - fed with wet steam from a steam generator mounted in the vault of the combustion chamber
GOLDYAK A A 22.09.76-SU-407831
(30.12.78) A21b-03/04

Break-baking oben, of the dead-end type, comprises a fire chamber, steam-generator, made in separate sections, steam-moisturing device, and system of pipelines. The quality of the bread is improved and loss in baking is reduced, by positioning the steam generator inside the vault of the combustion chamber and connecting by the pipeline system to the steam-moistening device.

Under the effects of the heat of the combustion chamber the water inside the steam-generator placed in the upper vault is converted into wet steam with the help of the steam collector and pipes feed it into the baking chamber in order to moisten the dough pieces. Such design ensures optimum temp. and steam-moistening regime inside the oven.

Goldyak A.A., Bul. 48/30.12.78 22.9.76 as 407831 (2pp29)

CASI/ D11 20076S/11 =SU -640-667
Non-watersoluble pentosanes as bread- - making adjuvants
CASIER J (CAS /) 09.10.69-LU-059598
*(30.12.78) *BE-755-788 +C13k-13*

Non-water-soluble pentosanes, useful as adjuvants in brea-dmaking or as gelling agents, are produced by treating one or more gramineous plants with a base sufficiently strong to extract the non-watersoluble pentosanes from the cells of the plant material but without solubilising the starches thereof, this treatment being effected at least temporarily at temps. up to 55°C, pref. 53-55°C at pH 13-8, pref. 11-12.5, for 24-48 hrs. opt. under an inert atmos. e.g. N_2.

The soln. obtd. is then electrodialysed at pH above 6 and spray dried. If desired, the grass plant material e.g. whole plants, seeds, stems, roots, leaves, etc. may be extracted with formaldehyde, alcohol, ether, etc. prior to the alkali treatment.

Kaze J., Bul. 48/30.12.78 9.10.70 as 482360 (2pp)

ELEK- ★ D11 B/39 ★SW 7801-548
Baking oven with air circulation fan - has valve that can block air inlet to oven chamber, so that air simply circulates inside heater chamber
ELEKTRO-DAHLEN AB 10.02.78-SW-001548
(10.09.79) A21b-01/24

A fan circulates air from a heater along an inlet channel, down a distributor channel, through the oven chamber and into a collector channel for return to the heater. The collector channel is directly opposite the distributor channel.

A two-posn. valve occupies the inlet channel and/or the collector channel. In one posn., the valve allows air circulation through the oven chamber as above. In its other posn., the valve blocks the inlet channel so that air circulates from the fan into the collector channel and back to the heater. 10.2.78 as 001548 (-pp1407)

UYAL- D11 59768B/32 =US 4168-334
Bread baking in earthenware pans - coated with terra sigillata to prevent adhesion
ALFRED UNIV RES FOU 27.04.77-US-791507
*L02 (18.09.79) *US4162-334 +A23l-01 C04b-35/14*

Cookware comprises a shaped, fired ceramic body having a fired layer comprising terra sigillata on at least the cooking surfaces of the body, the terra sigillata closing only a portion (esp. 30-60%) of the pores of the surfaces of the body.

Pref. the ceramic body is a brickware body, esp. of Alfred Shale. Pref. the cookware is in the shape of a bread pan. Bread baked in the pans has the taste and physical qualities of bread baked on a brick oven. The baked bread releases easily from the pan. 27.4.77 as 791507 (6pp992)

D12 : MEAT ; FISH PROCESSING

SCHM/ ★ D12 69989B/39 ★DL-136-329
Fish filleting machine attachment - with power cylinder adjusting transport chain height for fish size
SCHMIDT U 02.05.78-DL-205119
(04.07.79) A22c-25/16

An attachment for a fish filleting machine helps to guide the vertebral column under the guide plates after the fish bones have been cut free. Support elements for the endless chain conveyor are operated by a power cylinder and can be varied to suit the size of fish.

This makes the filleting machine suitable for a wider range of fish sizes. 2.5.78 as 205119 (6pp39)

GROT/ ★ D12 70092B/39 ★DL-136-697
Carcass scapula extraction device - with wire rope looped around the bond and linked to a motorised chain drive
GROTHE P 26.05.78-DL-205604
(25.07.79) A22c-17

A device for the mechanical extraction of bones, such as the scapula, from animal carcasses (beef and pork) consists of a wire rope which is looped around the bone. One end of the rope is attached to the collar of a handle and the other is linked to a traction medium, pref. a motorised chain drive.

This device is simple to operate and saves the manual labour for the scapula extraction. It causes a min. of meat losses. 26.5.78 as 205604 (11pp39)

GROT/ ★ D12 70093B/39 ★DL-136-698
Carcass scapula extraction device - with wire rope looped to the bone and linked to a power cylinder
GROTHE P 26.05.78-DL-205605
(25.07.79) A22c-17

A device for the extraction of bones such as scapulas from animal carcasses consists of a wire rope which is guided in a loop through a collar and fixed to it at one end. The other end is linked through a compression spring to an actuator, such as a hydraulic cylinder, which can develop a tractive force.

This saves the heavy manual labour for the extraction operation. The productivity is raised and the device is easy to mfr. 26.5.78 as 205605 (8pp39)

VERS- ★ D12 70189B/39 ★DT 2811-340
Sausage skin with longitudinal seam - enclosing sewn-in tear cord for easy unwrapping
VERSMOLDER FLEISCHW 16.03.78-DT-811340
(20.09.79) A23c-13

The skin is, in addition to the clips and hooks at each end, provided with a longitudinal seam along its length, in which a tear cord has been sewn in. By tearing on the cord, the seam is opened and the sausage contents can be readily separated from the skin.

Instead of tearing the threads of the seam, a double chain stitch can be used for the longitudinal seam so that the pulling of one of the threads releases the loops of the seam without having to destroy any threads. This makes it easier to peel the skin off a sausage. 16.3.78 as 811340 (7pp39)

PLAT/ ★ D12 70306B/39 ★FR 2411-570
Preparing flavoured ham - by incorporating flavouring agents inside the ham before cooking
PLATEAU P 19.12.77-FR-038175
(17.08.79) A23b-04/02

The process comprises dressing and brining the fresh ham in the normal manner and after leaving for about 24 hrs., it is de-boned and the rind and fat are carefully sepd. from the lean. The outside of the lean is then covered with a thin layer of flavouring agents and it is then dusted with food quality gelatine. The rind and fat are then replaced around the treated lean and before or after this, the space left in the lean by removal of the bone is filled up with flavouring agents. Finally the ham is moulded, cooked, cooled and removed from the mould.

The process ensures flavouring of the whole of the ham rather than just the surface and also gives a better fixation of the flavourings, particularly when the ham is sliced. The pref. flavouring is a mixture of Provence herbes and Alping Artemesia esp. in equal weights. 19.11.7 as 038175 (8pp597).

ATTE/ ★ D12 70353B/39 ★GB 2016-25
Prod. contg. fat globules surrounded by proteinaceous materials useful for making extrudable meat prods.
ATTECK L A G 30.04.79-GB-014893 (01.02.78-GB-003995)
(26.09.79) A23l-01/31

Prod. comprises ≥1 globule of fat (A) surrounded by proteinaceous material (B). Pref. (B), and therefore the prod., is hydrophilic; and is esp. defatted animal fat connective tissue. (A) is esp. animal fat.

The wt. ratio (A):(B) is ≯5:1, esp. 1:1, and (B) may additionally contain up to 20 wt.% absorbed water. The prod is made by reducing animal fat to small pieces, heating t render at least some fat, then sepg. rendered fat leaving the rest of the fat surrounded by (B). Water is pref. adde to the fat pieces esp. at 70-60°C.

The prod. is used to make extrudable meat prods. whic set quickly on heating and have minimal shrinkage and frying loss. 30.4.79 as 914893 (3pp1251)

KULS- ★ D12 70354B/39 ★GB 2016-257
Preserving freshly caught fish - by injecting gaseous carbon dioxide at various levels into vessel hold to displace air
KULSYRE-& TORISFABR 26.04.79-GB-014598 (14.03.78-GB-010145)
(26.09.79) A23b-04

Fish are preserved by placing in a vessel hold compartment, removing from the compartment the water draining off the fish over a period, injecting gaseous carbon dioxide to displace virtually all the air and fill all spaces between fish, and sealing the compartment until unloaded.

The carbon dioxide is pref. injected through hand-held lances inserted through a top opening or through a fixed distributor, at different depths. The fish are pref. disturbed by injecting carbon dioxide under pressure into the compartment lower end, and dry ice may also be placed in the compartment together with the fish. The method is more effective than the use of dry ice alone. 26.4.79 as 014598 (5pp1358)

BROU- ★ D12 70355B/39 ★GB 2016-258
Appts. for sepg. meat scraps from bones - with piston reciprocable to intermediate compacting position and final extruding position
HOLDING BROUWER M & 17.03.78-NL-002947
(26.09.79) A22c-17

An appts. for sepg. meat scraps from bones includes a press-chamber having a press-piston within it. The piston is movable between an initial position and a final position near the opposite end of the chamber from its initial position.

The piston can be driven within the chamber in two phases, one comprising an active partial stroke from the initial position to a position intermediate the initial and final positions and the other comprising an active full stroke from the initial to the final position. Pref. the full operating cycle of the appts. also includes a second active partial stroke. 16.3.79 as 009396 (5pp295)

DGIA/ ★ D12 B/39 ★IT 1032-255
Auxiliary table for holding pig carcass - during butchering and filleting
DI GIANCARLO C 13.01.78-IT-046803
(30.05.79) A22c

ZUEV/ ★ D12 71420B/39 ★SU-640-728
Pigs slaughtering and bleeding - by positioning them under suspended carriage from which an electric stunner and hollow bleeding knife act on the animals
ZUEV N G 23.12.75-SU-306346
(10.01.79) A22b-03

Device for slaughtering and bleeding animals, primarily the stunning of pigs with an electric current, includes an attachment for holding the animal in place and a hollow

ife with a rubber hose. The process is mechanis by
king the device as a carriage. L-shaped supporting fr-
e with sensors mounted on the carriage so that it can
ove horisontally relative to the animal, and a plate for
ientation of the hollow knife. The latter is hinged on the
shaped frame so that it can move vertically, with the
ife provided with a drive and mounted on a small plate.
The animal is held in position and the conveyor stops.
e carriage at the top moves along the suspended track
the direction of the animal. The lower part of the frame
ntains a light-sensor, which determines when the ray
light falling on it has been cut off by the animal's front
gs. The electrical-stunning attachment is lowered to
un the animal prior to slaughter. The hollow knife is
ought into position and moved so that it enters along
e sternum and the front legs. The drive is actuated so
at the knife kills the animal and the blood is removed
to a container. A time relay determines the length of
me of the bleeding process. The dead animal falls on
the conveyor and is removed for further processing.

VRIG/ ★ D12 71537B/39 ★US 4167-901
Meat dehydrator heated by domestic light bulb - with meat
upporting grill and surrounding aluminium cylinder
WRIGHT D C 30.06.78-US-921028
Q76 (18.09.79) A23b-04/04 F26b-19 F26b-25/06

meat dehydrator includes a circular base with a raised
erimeter lip on which stands a circular grill whose
erimeter is no greater than the perimeter of the lip of
he base. Brackets extend outwardly from the perimeter
f the grill to mount a cylinder with an open top and bottom which forms a chamber above the grill. There is a gap between the bottom of the cylinder and the base to allow air circulation.

A lid is movably mounted on the upper open end of the cylinder and on the centre of this a heating element may be mounted to extend downwardly into the chamber.

The dehydrator is designed esp. for domestic use.
30.6.78 as 921028 (6pp295)

BIRD/ ★ D12 71682B/39 ★US 4168-418
Appts. for rendering meat and blood to give dried prod. - using microwave energy angled for reflection along rendering chamber
BIRD L L 07.09.77-US-831177
R59 (18.09.79) H05b-09/06

Appts. comprises a cabinet contg. an elongate driven conveyor for transporting the materials from one end to the other of the cabinet. The cabinet and belt are formed of a substance which reflects microwave energy. The belt also includes perforations to drain off water and fat.

Microwave generators direct energy into the material on the belt. The energy inputs are angled so as to cause reflection of the microwave energy. At least one of the inputs is inclined at an acute angle and at least one other at an obtuse angle to give at least one region where there is intense rendering.

The appts. renders materials such as dead animal carcasses to obtain a dried meat product which can be used in animal feedstuffs, bone meal or fertilizers. The appts. uses the microwave energy efficiently. 7.9.77 as 831177 (11pp295)

D13: OTHER FOODSTUFFS

CORP ★ D13 69953B/39 ★BE -876-125
Starch and animal feed prodn. from wheat grain - by combined dry and wet milling
CPC INTERNATIONAL INC 11.05.78-US-904953
C03 P41 (03.09.79) B02c C13l

Continuous refining of wheat is carried out by first dry-milling the whole grain to give an endosperm fraction, a wheatgerm fraction, a fibre (bran) fraction and a middlings fraction. The endosperm fraction is then wet-milled by macerating, separating the larger particles from the smaller grinding the larger particles and recombining them with the smaller particles, and macerating the mixt. to form a starch slurry.

Residual fine fibres are sepd. from the starch slurry, which is then sepd. into a starch-rich fraction and a protein-rich fraction. The protein-rich fraction is then concd. and mixed with the bran fraction, the middlings fraction, the wheatgerm fraction and the residual fine fibres to form a moist product, which is then dried to obtain an animal feed.

The process gives high yields (e.g. 52%) of high-quality type-A starch and high yields (e.g. 48%) of animal feed as a useful by-product; short maceration times can be used. 9.5.79 as 876125 (25pp367)

YAKI/ ★ D13 69990B/39 ★DL -136-331
Feed additive for animals and poultry - contains perchlorate salt on porous carrier, for improving wt. gain and feed utilisation
YAKIMENKO L M 05.05.78-DL-205219
C03 (04.07.79) A23k-01/17

Compsn. for improved feeding of animals and poultry contains a perchlorate of formula $X(ClO_4)_n$ (I) (where X is alkali or alkaline earth metal or NH_4; n is the valency of X) on an inert, orally acceptable carrier.

Pref. the ClO_4^- ion content is 5-50, (15-35) wt. % and pref. (I) are Mg and/or Ca perchlorates. The carrier may be inorganic, esp. perlite, silica gel or diatomaceous earth, or organic, esp. sawdust or grass meal. The compsn. may also contain NaCl or an alkaline earth chloride.

Compsns. improve wt. gain and feed utilisation and in sheep increase wool yields. Compsns. are practically nontoxic and prod. no side effects, and the addn. of a carrier reduces the explosion hazard associated with (I). This is further reduced by incorporation of the NaCl or alkaline earth chloride. 5. 5. 78 as 205219 (26pp1251)

DUAN/ ★ D13 69992B/39 ★DL-136-340
Liquid mixing system for beverages - under oxygen exclusion in plate type heat exchanger at great turbulence
DUAN L 27.04.78-DL-205045
(04.07.79) B01f-03/08

Liquids, used for the prepn. of fruit juices and other beverages, are extracted from storage containers and pumped through a mixing tube into a plate-type heat exchanger under exclusion of atmospheric oxygen. The mixture is cooled or heated in it at an intense turbulence. After de-aeration in a tank, the beverage is pumped to the bottle filling machine A feedback recycles any excess to a return tank upstream of the mixing tube.

This provides a continuous system of high labour productivity, and low expenditure for energy and apparatus. 27. 4. 78 as 205045 (6pp39)

Chewing gum based on coniferous balsam - contg. glycerol, unflower oil, ethereal oil microcapsules, sugar powder, syrup and water

CONFECTIONERY RES 19.04.77-SU-477539

(30.12.78) A23g-03/30

Chewing gum is prepd. by mixing plasticised basic material with microcapsules of ethereal oils (I) sugar powder, syrup and other components, and shaping the mixt.

By initially dispersing the ethereal oils in the syrup, (heated to 40-45°C) and by introducing the sugar powder in two stages, viz one third of it at 60-65°C and the remainder at 50-55°C, the quality of the prod. is improved and the consumption of the ethereal oils is reduced.

Casein prodn. by coagulation from skimmed milk - includes adding whey in two stages at increasing acidity and temp. to accelerate casein pptn.

KINAREVSKAYA A I 03.05.76-SU-357579

A11 (30.12.78) A23j-01/20

Casein is obtd. by coagulation from skimmed milk. The coagulation is effected by adding acidic whey and mixing. Then a part of the whey is withdrawn, and the resulting curd is mixed with further acid whey. The sepd. curd is subsequently compressed comminuted and dried.

The process is accelerated by carrying out the coagulation of the casein in skimmed milk by addn. of acidic whey at 38-40°C and acidity 40-45°T; after 1-1.5 mins.. a part of the whey is withdrawn; the resulting curd is mixed with further whey (having a temp. of 52-55°C) until the acidity reaches 75-76°T; when the addn. of the whey is stopped, the stirring is continued for 5-10 mins.

Carbohydrate substitute fodder additive for non ruminants - obtained from liquor squeezed out from peat, neutralised with lime and partly evaporated used in animal bird etc. breeding

NON BLACK EARTH AGR 13.01.77-SU-445124

C03 (30.12.78) A23k-01

Carbohydrate fodder additives can be produced from vegetable wastes by a process comprising neutralisation with $Ca(OH)_2$ and subsequent drying.

The base of waste materials processed in this manner can be extended by utilising the liquor squeezed out from peat during the processing of the latter. The peat liquor is filtered; neutralised with $Ca(OH)_2$; evaporated at 105° C until the sugar concn. reaches 15-50% and allowed to settle at 35-40°C; the ppte. is sepd. and discarded; the resulting liquor contains 40% of solids (20% of sugar); the pH is 4.5.

A cabinet for freeze drying under vacuum and similar operations has at least two shelves supported by pegs projecting from their end faces, which can be raised and lowered. Inside the cabinet and close to opposing side walls, there are support panels which can be moved through a limited distance. These have ⩾ 2 slots at each side for each shelf. The pegs are guided in these and can be supported at one of ⩾ 2 heights, the difference between which can be considerable. The means of adjusting the height of much simpler than in existing cabinets of this type.

The slots in the support panels run vertically and have ⩾ 2 separate zones of different width joined by a step which forms a support for the peg. The hydraulic or pneumatic lifting mechanism acts directly and immediately on the bottom shelf. 1.6.76 as 624517 (6pp1045).

GATI/ ★ D14 70308B/39 ★FR 2411-576
Steam peeling of fruit and vegetables esp. potatoes - with preheat and air purge to avoid oxidation, discoloration and peeling losses
GATINEAU J A G 15.12.77-FR-037885
(17.08.79) A23n-07/02

The vegetables are exposed to high pressure, live steam in a sealed, rotary autoclave. The steamed vegetables are released from the autoclave and transferred to a mechanical peeler using brushes and/or high pressure jets of cold water. The autoclave is non subjected to a preheating period during which it is also purged of air before sealing and introducing high pressure steam.

The preheating/purging is pref. achieved by passing int the open autoclave steam at a pressure slightly above atmospheric. This can be done before or after loading prod. into the autoclave. Alternatively, the preheat/purge can be by means of a short burst of high pressure steam into the autoclave. Purging may be assisted by vacuum suction to the open autoclave. Such vacuum pressure is pref. of the order of 2 mmHg. The autoclave pref. operates at about 170°C and a steam pressure of about 8 bars.

The combined purging and pre-heating ensures that not only is air removed from the autoclave but that the heat drives out gases from the prod. itself before the autoclave is sealed. This prevents oxidation, discolouration and rapid deterioration of the peeled prod.. Heat transfer is improved, peeling losses reduced for increased yield, prod. appearance enhanced and shelf life increased. 15.12.77 as 037885 (17pp448).

Controlled electro-plasmolysis of vegetable pulp in food industry by correcting the voltage of the alternating current through the mi according to its resistivity
PAPCHENKO A YA 22.04.74-SU-020103
(30.12.78) A23n-01

The Parent Patent Cert. No. 454892 describes automatic control of electroplasmolysis of vegetable material, mainly juice-pulp mix, by regulating the voltage of alternating current through the mix according to its flow-rate. For maximum processing of the mix, the voltage is corrected according to the resistivity of the mixt. This method is useful inthe foodstuffs industry. It has regard to a qualitative criterion as well as the quantitative index, e.g. for apples.

Papchenko A. Ya., Gaichuk V.T., Burinskii V.S., Bul. 48/30.12.78 22.4.74 as 020103 Add to 454892 (2pp840)

J01 K06 (24.04.79) B01j-01/09

A cation-exchange resin and an anion-exchange resin are back-washed and sepd. in a regenerator of a mixed bed ion exchanger to regenerate both resins. The cation and anion-exchange resins are partially contaminated from the mutually opposite regenerants in the neighbourhood of the border line of the resins.

The greater part of the anion-exchange resin is then discharged from the regenerator to a tank to leave a small quantity of cation and anionexchange resins containing their contaminants. The small quantity of ion exchange resins contg. the contaminants parts are sepd. from the greater part of the cation exchange resin and discharged.

The noxious ions may be completely prevented from leaking into the treated water to stably and efficiently provide water of high purity. 3.10.77 as 117846(6pp35)

Phosphate removal from liq. e.g. sewage - by adjusting calcium:phosphate ratio and passing through towers packed with phosphate mineral

EBARA INFILCO KK 01.02.78-JA-010292

(17.08.79) C02b-01/23 C02c-05/02

Phosphates present in liqs., e.g. service water, sewage, night soil treatment liquor, industrial effluents, boiler water, etc., are removed by passed the liq. through a tower packed with a phosphate mineral contg. calcium phosphate.

The liq. to be treated is first regulated to pH 3-6 to remove M-alkalinity components and then to pH 6-11 by addn. of calcium cpd. to give a Ca/PO_4 molar wt. ratio of 1.0 to 5.0, and then the liq. is passed through a first stage packed tower, of ≥2 packed towers, at a flow rate to keep the packings fluidised. The treated liq. is then passed through the second stage tower at a flow rate to keep the packings stationary, while part of the treated liq. from the first stage tower is recycled in an amt. of 1/2 to 5 times the amt. of liq. to be treated.

Method is capable of easily and exactly removing phosphates present in all types of liq. in the form of calcium hydroxyapatite on the surface of rock phosphate mineral. 1. 2. 78 as 010292(5pp117)

HITA ★ D15 70683B/39 ★ J5 4104-649

Removal of ammoniacal from waste water - where cationic exchange resin is regenerated with sodium ion-contg. liquor of specified pH

HITACHI KK 06.02.78-JA-011476

(17.08.79) C02b-01/76 C02c-05/08

Waste water is brought into contact with a cationic exchange resin layer; the ammoniacal nitrogen-adsorbed cationic exchange resin or zeolite is regenerated by supplying a Na ion-contg. regeneration liquor of pH ≥10, composed of NaOH, Na_2CO_3, and NaCl, and also by introducing a gas e.g., air into the cationic exchange resin layer.

Contact between the cationic exchange resin layer and the Na ion-contg. regenerating liquor is made rapidly but sufficiently, and also the amt. of residual ammoniacal nitrogen remaining in the cationic exchange resin and the regenerating liquor used is much less than that in conventional methods. Thus, the waste regenerating liquor can be safely released and also the cationic exchange resin used required no washing with water. 6. 2. 78 as 011476 (6pp117)

NIRA ★ D15 70684B/39 ★ J5 4104-651

Recovery of valuable prods. - from wastes of heavy oil combustion exhaust gas treatment process, includes chelate resin regenerating process

UNITIKA KK 03.02.78-JA-011817

A91 J01 M25 (17.08.79) C01g-31 C01g-53 C02c-05/02

Valuable prods. are recovered from the wastes discharged from the heavy oil combustion exhaust gas treatment process, e.g., dust collected by the dust collector. byprods. in the desulphurisation process, byprods. in denitrification process, etc. The process consist of a vanadium adsorption process, in which an aq. soln. of wastes subject to pretreatment, e.g., precipitation, filteration, etc., is regulated at pH 2-4, and then passed through an aminocarboxylic acid-type chelate resin with hydrogen terminal gp. and iminodiacetic acid functional gp.

A nickel adsorption process consists of regulating the treated water from the vanadium adsorption process at pH 6-9, and then passing it through the aminocarboxylic acid-type chelate resins used in the vanadium and nickel adsorption processes by using an acid soln., and a chelate resin regenerating process.

This method is capable of effective and maximum recovery of nickel, vanadium, other valuable salts from the wastes at lower cost. 3. 2. 78 as 011817(5pp117)

Waste water treatment using activated sludge - after adjusting wt. ratio of carbohydrate(s) to protein and/or peptone cpds. and opt. adding nitrogen cpds.

MEIJI MILK PRODS KK 02.02.78-JA-009880

(D13) (17.08.79) C02c-01/06

In treating waste water contg. biological organic cpds., e.g., foods-mfg. waste water, including those discharged from milk prods. mfr. confectionary mfr., rice confectionary mfr., brewing etc., the wt. ratio of carbohydrate to protein and/or peptone present in waste water is first regulated to 0.2-5 by the addn. of a carbohydrate or protein on the basis of the analytical value of carbohydrate and protein and/or peptone opt. ≥25% an inorganic nitrogen cpd. and/or low mol. organic nitrogen cpd., e.g. ammonium sulphate, urea, etc., is then added;finally the water is subjected to activated sludge treatment.

Accumulation of high molecular cpds. in the activated sludge flocs is supressed thus preventing bulking and also improving the sedimentation and filterability of the excess sludge. 2. 2. 78 as 009880(5pp117)

DAUC ★ D15 70822B/39 ★ J5 4105-844

Decomposition of small amts. of free chlorine in water - by passing through or contacting with calcium sulphate(-based) pellets

DAIICHI SEIYAKU KK 06.02.78-JA-012179

A81 E36 (20.08.79) C02b-01/23

Small amts. in e.g. service water are decomposed by passing the water through or contacting it with Ca sulphite particles or a Ca sulphite-contg. pellet or tablet formed by using a base material (I).

(I) is e.g. ethylcellulose, 2-methyl-5-vinylpyridine-methylacrylate-methacrylic acid copolymer, diethylaminoethyl methacrylate, polyvinylacetaldiethylaminoacetate, dimethylaminoethylmethacrylate-methylmethacrylate copolymer, cellulose acetate N,N-di-n-butylhydroxypropyl ether, carboxymethyl(benzylamino)cellulose, shellac, cellulose acetate phthalate, etc.

Process can be effected on a large scale. In an example, the chlorine content of 0.085-0.169 ppm of water sample was lowered to 0-0.001 ppm by using 45 g of Ca sulphite. 6. 2. 78 as 012179 (3pp117)

HITF ★ D15 70823B/39 ★ J5 4105-846

Treatment of moisture-rich sludge and muddy water - by adding silicic acid sol and slaked lime soln. and stirring, to facilitate dewatering

HITACHI SHIPBLD ENGG KK 06.02.78-JA-012554

(20.08.79) B01j-01 C02c-03

The sludge is mixed with an acid silicic acid sol., prepd. by dissolving sodium silicate or potassium silicate in sulphuric acid, etc., to a sol. of pH 1-2, in a mixing tank equipped with ribbon screw conveyor and sent to the end portion of the mixing tank while being sufficiently mixed, and then the sludge so treated with the acid silicic acid sol. is further mixed with a slaked lime soln. of pH 11-11.6, prepd. by dissolving 10% slaked lime in fresh water, with slow tempo-stirring by screw conveyer to exhaust the gelled sludge to the outside.

This method is capable of treating the moisture-rich sludges or muddy water to highly dehydrated state or an easy-to-dehydrate state which makes its post-treatment easier and faster, i.e.. the transportation and dumping of the sludge are made easier. This treatment can be performed by using small amts. of lime, and the gelled sludge is applicable not only to land fill but also to the breeding of vegetables. 6. 2. 78 as 012554 (2pp117)

Fine coal powder oxidn. bed for waste water treatment - used for removing suspended solids, hexane extracts, BOD and COD components, nitrogen cpds., etc.

IKI S 06.02.78-JA-011507

(20.08.79) C02c-05

Waste water suspended with fine coal powder as oxygen carrier is dropped in an atomised state or a thin film state, during which BOD and COD components are oxidised by the atmospheric oxygen and N-hexane extracts and fine suspended solids are adsorbed onto the fine coal powder.

Method effectively removes suspended solids, N-hexane extracts, water-soluble BOD and COD components, inorganic nitrogen cpds., etc. concurrently without any trouble at lower running cost. When the treated waste water is put in a sedimentation basin, cake contg. fine coal powder is rapidly pptd. to give highly purified supernatant liquor. When the cake generated is treated by a dehydrator, dehydration can easily be attained to an extent less than moisture content of cake obtd. 6.2.78 as 011507 (2pp)

SEKI/ ★ D15 70825B/39 ★ J5 4105-849

Treatment of high COD waste water - by mixing with fine coal powder, carbon and an acid, electrolytically treating, then adding coagulant

SEKI T 06.02.78-JA-011514

A91 (20.08.79) C02c-05

Treating high-COD waste water, e.g., those discharged from chemical-mfg. factories, asphalt-refining, plating, dye-mfg., dyeing, paper-making pulp mill, food processing, waste incinerators, petrochemicals, etc., is claimed. High-COD waste water is mixed with 0.1-5 wt.% fine coal powder of grain size $\geqslant$85 wt.% 9-500 mesh, 0.05-0 wt.% fine carbon, and an acid e.g., H_2SO_4, HCl, etc., for regulating pH value to 2-4. The mixt. is then electrolytically treated in the presence of an electrolyte e.g., NaCl, $NaSO_4$, etc., and then neutralised as required. The mixt. is then treated with a coagulant, e.g., polyacrylic acid, polymethacrylic acid, CMC, etc. to sediment COD flocs which are in turn sepd.

Method is capable of effectively and rapidly treating high-COD waste water, providing a practically COD-free clean treated water and a low moisture content of flocs cake which can be easily burned. 6.2.78 as 011514 (5pp)

BASE/ ★ D15 70826B/39 ★ J5 4105-851

Biologically treating sewage, industrial effluents, etc. - by plunging water-permeable container contg. granular adsorbent and e.g. foamed phenol resin into the waste water

BASE N 07.02.78-JA-012689

A97 (20.08.79) C02c-05/02

Sewage, industrial effluent, etc., contg. harmful substances, e.g. heavy metals, N cpds., phosphates, etc., is treated by immersing a water-permeable container, e.g., unwoven or woven fabric bag-like container of synthetic fibre (e.g. polypropylene) or other anti-corrosive material, into which a granular adsorbent, e.g. activated carbon, ion exchange resin, chelate resin, Ca silicate, powdered shell, zeolite, coal, activated alumina, Mg aluminate, porous synthetic resin, etc., is housed with a floater, e.g. foamed phenol resin, foamed silica, ping-pong ball, etc., into the waste water.

Impurities can be removed both in trace and in great amts. Recovery and regeneration of adsorbents is facilitated. 7.2.78 as 101689 (4pp117)

NITL ★ D15 70827B/39 ★ J5 4105-852

Sepn. of foods, drugs etc. from soln. - in multistage separator where fungicide is added periodically to the soln. between each stage

NITTO ELECTRIC IND KK 07.02.78-JA-013176

(20.08.79) C02b-01/82 C02c-05/02

Liquor and/or conc. liquor sepd. by a soln. separator of multi-stage separators is supplied to the next separator or recycled to the same separator, during which a fungicide, e.g., formalin, sodium hypochlorite, chlorine, iodine, a cationic surfactant, an amphoteric surfactant, hydrogen peroxide, sorbic acid, dehydroacetic acid, beta-propiolactone, boric acid, salcylic acid, benzoic acid, peracetic acid, etc., is added periodically to each soln. flow path between multi-stage separators.

The method is capable of keeping the fungicide concn of soln. almost constant at each stage, thus permitting the growth of microorganisms and the lowering of desal nation and water permeation rates due to the attack of microorganisms to be suppressed effectively. Method i useful for the purificn. and sepn. of foods, drugs, fermented prods., etc., or for reverse osmosis sepn., ultrafiltration, micro-filtration, etc., in sewage tertiary t eatment, building waste water treatment, oil-contg. wa te water treatment, etc. 7.2.78 as 013176 (3pp117)

Vater filtering appts. using macromolecular membrane filter - has a vater cooler and closed water circuit for controlling microbes etc.
NOMURA MICRO SCIENC 08.02.78-JA-012302
J01 (20.08.79) B01d-13 C02b-03/02

The water filtering appts. comprises a raw water supply pump, a prefilter, a membrane filter, pipes for connecting the supply pump, the prefilter and the membrane filter a permeated water transfer pipe, and a concentrated water transfer pipe.

Respective branch pipes of the transfer pipes are connected to a water cooler and also connected through a circulating pump to the connect pipe so as to form a closed water circuit. When the drive or filtering operation of the appts. is stopped, the water is circulated in the closed water circuit. Then, the water cooler is regulated to a water temp. of 5-15°C to restrain the increase of microbes effectively.

The life of macromolecular membrane may be considerably lengthened, and the increase of microbes may be easily and automatically prevented without requirement of germicide and cleaning, so that a great quantity of water and drive time may be saved. The system may be widely used in the water treatment in electronic industries, medicine mfr. and food industries. 8. 2. 78 as 012302 (3pp35)

ASAG ★ D15 70883B/39 ★ J5 4106-097
Treating zinc sulphate-contg. tail soln. from zinc electrolysis - using dialysis to recover sulphuric acid which is recycled to the zinc prodn.
ASAHI GLASS KK (AKIT) 07.02.78-JA-011951
E32 M28 (20.08.79) C01b-17/90 C02c-01/16 C02c-05/02

The process recovers sulphuric acid from the tail soln. at low cost, to lower the prodn. cost of the zinc electrolysis

In an example, electrolysis tail soln. (153 g/l H_2SO_4, 53 g/l Zn, 15 g/l Mg, 2 g/l Mn and traces of Fe, Cd and Na) was dialysed through an anion-exchange membrane (strongly basic styrene-divinylbenzene). From the recovery side 126 g/l H_2SO_4 and 0.8 g/l Zn soln. was steadily obtd. 7. 2. 78 as 011951 (5pp96)

EBAI D15 13416Y/08 = J7 9025-749
Removal of phosphate from waste water - by contact with calcium phosphate rock at pH greater than 6
EBARA INFILCO KK (EBAR) 07.12.73-JA-136088
*J01 (30.08.79) *J50088-851 +B01d-15 C02b-01/23 C02c-05/02*

The phosphate-removal efficiency of the rock is much greater than that of active carbon. To a waste water contg. orthophosphate 10 ppm was added Florida phosphate rock powder (200-300 mesh) to a final concn. of 4000 ppm. The mixt. was stirred at 120 rpm and 25° for 2 hrs. and filtered.

The filtrate thus obtd. contained 0.1 mg/l. phosphoric acid; compared with 2.42 mg/l., when the waste water was treated with equal concn. of active carbon. 7. 12. 73 as 136088 C02b-1/23; B01d-15/00; C02c-5/02 (30. 8. 79) EBARA-INFILCO KK (5pp) (J50088851)

Biochemical sulphate cpds. from waste water removal - by conversion to sulphur with activated sludge at specified temp. and acidity
WATER SUPPLY HYDROT 21.09.77-SU-525766
(30.01.79) C02c-05/10

Biochemical redn. of sulphates in water can be simplified and the cost of the process reduced if the water is treated anaerobically with activated sludge at a pH of 5.5-7.2 and a temp. of 35-40°C. for 48-96 hr. The method gives better results than use of farm-sewage wastes at pH 2.8-4.5 over a period of 24 hr., as this method necessitated an extra stage for removal of the H_2S and S formed, and had a corrosive effect on the appts. owing to the low pH and the presence of H_2S.

The activated sludge used contains Desulfovibrio salexigens as the active agent, and is used in a ratio of 1:1 to the water. The prod. of the reaction is sulphur, which is readily sepd. by known methods. The method only requires simple appts. and is carried out in only slightly acid medium.

Suspended organic and mineral cpds. in faecal waste water removal by three-stage electrolytic flotation and coagulation wit simultaneous sterilisation
LENGD ENG-CONS INST 03.06.77-SU-493107
(30.01.79) C02c-05/12

Faecal aq. waste is subjected to electroflotation followed by electrocoagulation and a second electroflotation.

Simultaneous purificn. and sterilization of the faecal waste water can be achieved if the first flotation is carried out in presence of Cl^- at a current density of 3-7 m. amp/cm^2 for 4-6 min., and the second at 4-6 m.amp for 5-9 min., instead of using 10 m.amp/cm^2 and 15 min for both stages. The Coli index for the improved process wa 20 or less compared to a norm of 1000.

Vapour compression distillation in tubed heat exchanger - with vapour passing downwards through duct and then moving upwards

POTTHARST J E 09.06.78-US-914128 (09.11.73-US-414293)

(18.09.79) B01d-01/28 C02b-01/04

A vapour compression distillation apparatus includes a vertical shell-and-tube vapourizer. The tubes extend between upper and lower horizontal tube plates with the lower plate being submerged beneath the feed liquid. Vapour discharged from the upper tube plate enters a vertical duct which runs down the side of the tubes until it passes a baffle. Adjacent the baffle the vapour flow reverses and it passes upwards therby releasing entrained droplets.

Vapour is compressed and fed to the shell side of the vapourizer where it is condensed to yield a product. The liquid feed inlet discharges into the vertical duet and breaks up the froth formed on the surface of the liquid body at the base of the appts.

The appts. distills brackish water and achieves high heat transfer rates. Reversing the vapour flow release entrained droplets. 9.6.78 as 914128 (+18.8.75-US-605293) (14pp295)

Aerobic waste water purification process - with recycling of activated sludge and powdered activated carbon

STANDARD OIL CO (IND) 15.06.77-US-806748

(18.09.79) C02c-01/06 C02c-05/10

In a process for the purification of waste water, the water is fed to a first clarification zone where easily removable solids are sepd. The effluent passes on to a filtration or air flotation zone where the suspended solids are separated from the water. The effluent is next passed to an aeration zone where it is contacted with activated sludge having an average sludge age greater than 10 days. Powdered carbon is also contacted with the water and oxygen or air is introduced into the water-sludge-carbon mixture.

The effluent from this last zone is passed to a sec. clarification zone to obtain pure wate and a mixture of sludge and a carbon a portion of which is recycled to the filtration or air flotation zone effluent and a second portion of which is recycled to the first clarification zone effluents.

The process is used to treat contaminated water from municipal or industrial sources to give max. puritication with min. cost. 15.6.77 as 805748 (9pp295)

Automatic activated sludge control system - measuring rate of settling of sludge and suspended solids

WATERMATION INC 16.08.78-US-934201

(18.09.79) B01d-21/24

In a sewage treatment plant an automatic sludge control system is operated electronically and includes a sample pump which delivers a sample to a settleometer jar. The interface level in the jar between the settled sludge and supernatant blanket fluid is optically detected. After his measurement the jar is automatically emptied and cleaned.

A centrifuge holds test tubes which are each adapted to receive a sample from the pump. After centrifuging the interface level between the settled solids and supernatant blanket fluid is optically tested. The tubes are emptied and cleaned automatically. The amt. of sludge in the jar and settled solids in the tubes is computed and an output signal is generated indicative of the relative quantity of sludge and solids.

The system is used to test the recycled sludge in a sewage system. The condition of this sludge is determined by measuring the amt. of solids suspended in the fluid and the settling rate of the activated sludge. The results of the testing can be used to control the amt. of activated sludge which is recycled for optimum efficiency of the system. The method replaces a much slower manual process. 16.8.78 as 934201 (7pp295)

Antibiotic SF-1993, prepd. from Streptomyces strain - is used against Gram-negative bacteria and yeast or fungi
MEIJI SEIKA KAISHA 27.01.78-JA-007333
B04 (15.08.79) A61k-35/74 C07g-11 C12d-09/14

The new antibiotic SF-1993 comprises neutral, colourless needles of m.pt. 158-159°C (from methanol), and has $[\alpha]^{20}_{D}$ +73.6° (in water), elementary analysis 38.17% C, 6.45% H, 11.84% N, and 43.54% O, mol. wt. 320 as (estimated by vapour pressure method) and specified IR, NMR and UV spectra. It is soluble in water, hardly soluble in methanol and insoluble in acetone, benzene and ethyl acetate.

The colour reactions show positive to potassium permanganate, silver nitrate-potassium hydroxide, resorcinol-HCl and Ehrlich reactions, and negative to ninhydrin and 2,3,5-triphenyltetrazolium reactions. 21.2.78 as 007333 (7pp33)

TAKE ★ D16 70698B/39 ★ J5 4104-896

Pretreating agent for removing natural agglutinin s) etc. from serum - consists of aq. suspension of fixed erythrocytes and kaolin particles

TAKEDA CHEMICAL IND KK 06.02.78-JA-012655

B04 R16 (17.08.79) G01n-33/16

A pre-treating agent for virus agglutination reaction consists of (A) aq. suspension contg. (a) fixed erythrocyte of fowls and (b) kaolin particles. The formulation of the pre-treating agent is freeze-dried substance of (A).

The fowls include hen, goose, duck, etc. The erythrocyte is fixed with, e.g. formalin, glutaraldehyde, etc. (b) has particle dias. of 100-325 mesh. The medium of (A) are e.g., distilled water, buffer soln., etc. and the pH of (A) is 6.0-9.0.

The pre-treating agent completely removes non-specific agglutination-inhibitors and natural agglutinins in a single step by a simple method. 6.2.78 as 012655(5pp90)

ASAH ★ D16 70714B/39 ★ J5 4105-063

Prepn. of compost from starch-type organic material - by heating and aerobically fermenting in presence of nitrogen, phosphorus and potassium sources

ASAHI CHEMICAL IND KK 23.01.78-JA-005171

(D17) (17.08.79) C05f-09/04

Process comprises (a) heating starch-type organic material (I); (b) aerobically fermenting the treated material with the addn. of N-, P- and K sources; and (c) maturing the prod.

Starch refuse generated e.g. in the mfr. of starch, paste, corrugated cardboard or noodles, can be reused as compost.

Pref. (I) include starch and starch derivs. such as the acetyl ester, methylether and allylester. Pref. (I) has a water content of $\geq$30% (40-80%). Pref. heating is effected at 50-100°C, for 3-60 secs. Suitable N sources include activated sludge, fermentation liq. waste, excrements of domestic animals, ammonium phosphate, ammonium sulphate, etc. 23.1.78 as 005171(3pp108)

Solid preparations of lysozyme - obtd. by dissolving lysozyme in water and mixing with phospholipid and sorbitan unsatd. fatty acid

EISAI KK 31.01.78-JA-008867

B04 (18.08.79) A61k-09/14 A61k-47

Solid prepns. of lysozyme are obtd. by dissolving lysozyme in a hydrophilic solvent (esp. water), mixing the soln. with a phospholipid and sorbitan unsatd. fatty acid ester and formulating the resultant mixt. into a suitable dosage form.

Lysozyme is useful as a mucolytic enzyme. The prepn. is stable to the action of pepsin in stomach.

Examples of the phospholipid are phosphatidylcholine, phosphatidylethanolamine, phosphatidylserine, phosphatidylinositol and lecithin. The sorbitan unsatd. fatty acid esters include sorbitan monooleate, sorbitan dioleate, sorbitan trioleate and their mixt. 31.1.78 as 008867 (5pp33)

MITD ★ D16 70797B/39 ★ J5 4105-286

Fixed microbial enzyme prepn. - by freezing microbial body showing enzymatic activity, defrosting, adding gelatin or casein sodium, kneading, solidifying and drying

MITSUI SEITO KK 31.01.78-JA-008825

A97 (18.08.79) C07g-07/02 C12d-13 C12k-01

The method comprises (a) freezing the microbial body showing enzymic activity, (b) defrosting, (c) adding gelatin or casein sodium 2-20% on the solid of the microbial body, (d) kneading the mixt. to paste, (e) immersing in acetone soln. contg. glutaraldehyde 0.2-1.0% for solidifying the paste, (f) removing the soln. by filtration and (g) drying without washing.

Almost all kinds of endoenzymes can be easily fixed inexpensively in granules using glutaraldehyde as the crosslinking agent and gelatin or casein sodium as the reinforcing agent.

Pref. viscosity-increasing agent (e.g. gum arabic, dextrin, CMC, guar gum, etc.) in amt. of 2-20% on the solid of the microbial body is combined with gelatin or casein sodium for obtg. porous fixed enzyme. 31.1.78 as 008825 (7pp5)

Cultivating methanol-utilising microbes - using a culture m
contg. sea water and methanol as carbon source

MITSUBISHI GAS CHEM IND 01.02.78-JA-010250

(18.08.79) C12b-03/02

The method is to culture the methanol-utilisable mic
in a culture medium contg. methanol as the carbon sc
and uses uses sea water or a mixt. of fresh water an
water in prepg. the culture medium.

Hansenula polymorpha I-3 FERM-P 3929, Candida
dinii, Torulopsis methanoescle, Hansenula hirodendo
and Pichia pastolis can be used. Among them H. poly
pha I-3 is pref., because it can multiply under acidic
dition of pH 3.0-4.5 and gives high yield for microbia
body of high protein content.

Some microbes can be cultured sufficiently in the c
ure medium prepd. with sea water or the mixt. of fre
water and sea water. Sea water contains various ions
some vitamins and they can be utilised effectively. 1.

Anaerobic bacteria culture process - carried out in sealed ves
presence of oxygen-absorbing compsn. contg. ascorbic ac
ferrous sulphate

TOPPAN PRINTING KK 31.01.78-JA-010282

(18.08.79) C12k-03

Method comprises sealing an ascorbic acid-contg. or
rous sulphate-contg. O_2-absorbent compsn. together w
the culture medium, in which anaerobic bacteria are i
culated, in an airtight vessel. Anaerobic conditions ar
thus easily provided without complex processes and sp
ial equipment. The culture can be carried out over a w
temp. range without wetting or drying the culture medi
excessively.

Typical compsns. of the O_2 absorber are as follows:
(A) Fe powder 11 pt. wt., $FeSO_4.7H_2O$ 16.5 pts. wt.,
$Ca(OH)_2$ 4.4 pts. wt., $Na_2SO_3.7H_2O$ 3 pts. wt., $CaCl_2.2H$
2.5 pts. wt. and active carbon 1 pt. wt.; (B) Fe powder
pts. wt., $FeSO_4.7H_2O$ 35 pts. wt., $Ca(OH)_2$ 6 pts. wt.,
$Na_2SO_3.7H_2O$ 4.5 pts. wt., $NaHCO_3$ 2 pts. wt., $CaCl_2.2H$
2.5 pts. wt. and active carbon 1 pt. wt.; (C) L-ascorbic
acid 10 pts. wt., $Ca(OH)_2$ 30 pts. wt., CuCl 1 pt. wt. and
active carbon 5 pts. wt.; (D) L-ascorbic acid 6 pts. wt.,
$FeSO_4.7H_2O$ 2 pts. wt., $Ca(OH)_2$ 4 pts. wt. and $Na_2CO_3.1$
H_2O 10 pts. wt.

The compsns. are packed in a material having suitab
gas-permeability, and during storage they are packed i
gas-barrier material. Compsns. (A) and (C) absorb O_2
and compsns. (B) and (D) absorb O_2 with formation of
CO_2. 31.1.78 as 010282 (3pp5)

MITR ★ D16 70800B/39 ★ J5 4105-2

Insolubilised enzyme prepn. - by dispersing ice pieces con
enzymes in soln. of water-insol. high mol. cpd. in organic solve
and removing solvent

MITSUBISHI RAYON KK 30.01.78-JA-009176

A97 (18.08.79) C07g-07/02

Method comprises dispersing ice pieces contg. enzyme
a soln. obtd. by dissolving water insoluble high mol. su
stance in organic solvent and removing the organic solve
from the dispersion to include the ice pieces in the wate
insoluble high mol. substance.

Enzyme is once included in ice and enzyme can be inc
luded in water insoluble high mol. substance without los
of enzymic activity.

The removal of the organic solvent is practiced either
under reduced pressure or with the non-solvent for the
water insoluble high mol. substance. The ice pieces incl
-ding enzyme are obtd. by freezing the aq. soln. contg.
enzyme in the liq. cooling medium, which is the organic
cpd. having m.pt. or solidifying point below 0°C. in ice
pieces having dia. $\leq$ 1 mm.

As water insoluble high mol. substance cellulose acet-
ate, ethylcellulose and the polymers such as polyacrylon-
itrile, polyacrylate, polymethacrylate, polystyrene, pol
vinylacetate, polyvinylchloride and their copolymers can
be used. Though the enzyme is apparently insolubilised a
the time when ice is melted, the porous insolubilised en
yme having large surface area, can be obtd. by freeze-

drying it under vacuum. 30.1.78 as 009176 (9pp5)

AKA- ★ D16 70801B/39 ★ J5 4105-291

holesterol-oxidising enzyme prepn. - by culturing basidiomycete elonging to Agrocybe

TAKARA SHUZO KK 01.02.78-JA-010735

B04 (18.08.79) C12d-13/10

Method is characterised by culturing Bacidiomycete belonging to Agrocybe and recovering cholesterol-oxidising enzyme (c-oxidase) accumulated in the cultured liq.

The c-oxidase is produced extracellularly and non-adaptively. Objective c-oxidase can dehydrogenise the hydroxyl gp. on the 3β-position of cholesterol and sterols to form H_2O_2 and can be used for enzymic assay of cholesterol.

Pref. Agrocybe pediades K-1(FERM-P 4343) is used giving c-oxidase in the culture medium free of cholesterol. The culture is at 20-35°C at pH 4-7 for 2-7 days. The enzyme is exoenzyme and after removing the microbial body by filtration, the enzyme can be sepd. by adding an organic solvent, resin, pptg. agent, etc. to the filtrate. Then, the enzyme is refined by gel filtration, column chromatography, dialysis, etc. Objective c-oxidase has optimum pH at 6.0-7.0 and optimum temp. at 40-50°C. 1.2.78 as 010735 (6pp5)

Fermentative prodn. of coenzyme/Q-10 - by cultivating Protaminobacter rubber under aerobic conditions

MITSUBISHI GAS CHEM IND 06.02.78-JA-012208

B05 (18.08.79) C12d-03/02 C12d-13/10

Fermentative prodn. of coenzyme Q_{10} comprises cultivating a coenzyme Q_{10}-producing strain of Protaminobacter in a nutrient medium and extracting the produced coenzyme Q_{10} from the cultured cells. A pref. strain is Protaminobacter ruber. The fermentation is carried out at 20-45 °C under aerobic conditions. During fermentation, the medium is kept at pH 5-10, pref. 6-7.5.

Coenzyme Q_{10} is useful as a pharmaceutical and an element of animal health prods. Mass prodn. of coenzyme Q_{10} is possible. 6.2.78 as 012208 (4pp)

MITU ★ D16 70803B/39 ★ J5 4105-294

Sepg. androsta-3,17-di:one(s) from steroid impurities - by acylating and crystallisation or column chromatography

MITSUBISHI CHEM IND KK 01.02.78-JA-010160

B01 (18.08.79) C07j-09 C12d-13

The method comprises contacting a mixt. contg. androsta-1,4-diene-3,17-dione (ADD) or androsta-4-ene-3,17-dione (4AD) and >20-hydroxymethylpregna-1,4-diene-3-one (HPD) or 20-hydroxymethylpregnene-4-ene-3-one (4HD) as the impurities with acylating agent at the presence of inert solvent e.g. pyridine at -20-100°C for acylating the hydroxyl gp. of HPD or 4HP selectively and sepg. ADD or 4AD from the acylated steroid mixt.

ADD and 4AD are important intermediates for steroid cpds. and they have been prepd. by oxidising steroids microbially. The obtd. ADD and 4AD usually contain byproduced steroids such as HPD, 4HP, etc. which have been difficult to separate from ADD and 4AD. By acylating the hydroxyl gp. of HPD and 4HP the solubility of HPD and 4HP in organic solvent can be increased and the adsorptive property of HPD and 4HP on the adsorbent e.g. silica gel, alumina, etc. used in column chromatography, can be decreased, ADD and 4AD can be easily sepd. from impurities such as HPD, 4HP, etc. by crystallisation or column chromatography.

As acylating agent acetic anhydride, propionic anhydride, acetylchloride, benzoic anhydride, benzylchloride, etc. can be used. 1.2.78 as 010160 (8pp5)

Peptide synthesis - using polynucleotide carrier and/or enzymatic de protection and/or special methods of prod. purificn.

PIERCE CHEMICAL CO 09.03.78-NL-002578

B04 (11.09.79) C07c-103/52

The following processes for synthesising peptide chains with a predetermined sequence of amino acid segments are claimed.

(A) A pure intermediate complex comprising a 1st amino acid segment (Ia) covalently bonded to a polynucleotide (IIa), in which (Ia) has a free terminal COOH or NH_2 gp., is reacted in an aq. medium with a 2nd amino acid segment (Ib) having a protected COOH or α-NH_2 gp. respectively. Any unreacted complex is then opt. remoed, and (IIa) is reversibly coupled to a complementary polynucleotide (IIb) immobilised on an insoluble carrier. The prod. is sepd. from unreacted (Ib), and (IIa) is released from (IIb). Then, opt., the COOH or NH_2 group is deprotected the process is repeated until the required no. of amino acid segments have been added, and the peptide chain is released from (IIa).

(B) A pure intermediate contg. a 1st amino acid segment with a free terminal COOH or NH_2 group is reacted in an aq. medium with a 2nd amino acid segment having a COOH or α-NH_2 group respectively protected by an enzymatically hydrolysable protecting group, and the resulting peptide is enzymatically deprotected.

(C) A pure intermediate contg. a 1st amino acid segment with a free terminal COOH or NH_2 group is reacted in an aq. medium with a 2nd amino acid segment having a protected COOH or α-NH_2 group respectively, and any unreacted intermediate is removed by enzymatic decompsn or scavenging. 9.3.78 as 002578 (36pp367)

Processing freshly harvested tobacco leaves - by drying, fermenting in two stages at different temp. and humidity, sorting and packing
TOBACCO MAKHORKA 21.07.76-SU-393846
P15 (30.12.78) A24b-03/12

Tobacco leaves are dried, sorted, fermented and packed. This method is simplified by effecting the fermentation immediately after the drying, but before the sorting and packing.

The fermentation is performed in two stages. In the first stage, the leaves are kept in air having relative humidity of 80-90% at 40 °C for 1 h.; then the temp. is risen to 70-80 °C and the humidity is reduced to 60-75% over 0.5 hr. The latter conditions are maintained throughout the second stage for 5-9 h.

By this method, the duration of the process is reduced the cost is decreased. The quality of the prod. is improved, in particular its colour, scent and elasticity.

Semi-finished fur skin treatment unit - flexes the skin for adhesive o polymer bonding of additional hair in electrostatic field
UKR MIN LOCAL IND 04.04.75-SU-120069
A35 (A97) (30.12.78) C14b-15/12

Wider range of semi-finished fur treatment at lower labou cost is ensured by bending over before bonding to expose the skin side. The bonding of additional har covering is carried out on the exposed skin together with the natural hair. The combing and bonding of the additional hair take place in the electrostatic field.

The bonding can be carried out with polymer granules subject to hf current or to ultrasonic action, and then the skin passes around a heated drum to which the hair is pressed by a conveyor belt. The drum is followed by a multi-section oven featuring zones at different temps.

An aq. high foaming compsn. for dyeing hair comprises (i) sufficient amt. of basic dyestuff to impart colour, (ii) 1-10 wt.% of an anionic-cationic detergent complex having a motor ratio of amonic to cationic detergent of 65:35-35:65, (iii) 2-8 wt.% of nonionic surfactant and (iv) 1-10 wt.% isopropanol.

Pref. the anionic component of the complex is an Na or K soap, alkyl sulphonate or alkanyl sulphonate. The cationic component is pref. 8-18C alkyl trimethyl ammonium salt, di-quat-amine salt, ethoxifated quat ammonium sat in alkylpyridinium chloride. Pref. an aerosol propellant is included.

The compsn. has good intensity of dyeing, even in darker shades. It gives good coverage of hair contg. 15-25 grey. 14.7.75 as 595462 (+2.11.71, 28.11.73-US-195012 419557) (5pp964)

Dentifrice
LEVER BROTHERS CO 03.03.67-GB-010248
*(18.09.79) *BE-711-443 A61k-07/16*

A dentifrice is prepd. contg. a total content of abrasive agent of ≥ 40wt.%. The abrasive agent comprises ≥ 30 wt.% of alpha-alumina trihydrate of particle size distribution such that ≥ 20 wt.% of the particles have a size > 20 microns.

Pref. the particles of the trihydrate have a normal gaussian distribution, and a wt. median dia. of 16-23 microns. ≥ 50 wt.% of the particles of trihydrate have a size > 10 microns, 25-60 wt.% have a size > 20 microns, 5-30 wt.% have a size > 30 microns, and ≤ 15 wt.% have a size > 40 microns.

The alpha-alumina trihydrate compsn. prepd. is capable of giving high cleaning with realtively low enamel abrasion. Other conventional ingredients can be included in the dentrifrice, which can be in the form of a paste.

Absorbent pad for sanitary towel, disposable napkin, etc. - combines rapid absorption rate of peak flow with high retention capacity
COLGATE PALMOLIVE CO 27.03.78-US-890156
A96 P32 (16.07.79) A61f

A sanitary pad contains a composite, absorbent filling comprising a sheet of ripple cloth sandwiched between two layers of fluffy pulp. A sheet of cotton wool covers the outer face of each pulp layer. A waterproof film covers the outside of one only of the cotton wool sheets and the edges of the film are seamed to the edges of the second, cotton wool sheet which, in fact, forms the absorbent face of the pad. The foregoing, composite filling is enveloped in a sheet of unwoven, textile material.

The outer side of the pulp layer adjacent the absorbent face of the pad, is deeply channelled by crimping which powerfully compresses material in the bases of the channels. Each channel pref. has a depth equal to about four-fifths of the thickness of the pulp layer. The channels are pref. interconnected by grooves which may be shallower or just as deep as the channels.

Very high absorption rate to cope with peak discharge flow of liq. over short periods. This is achieved without sacrificing high retention capacity for liq. over long periods. 26.3.79 as 875097 (11pp448)

COLG ★ D22 69952B/39 ★BE -875-098

Mfg. absorbent pad for sanitary towel, disposable napkin, etc. - to give rapid absorption rate combined with high retention capacity for liq.

COLGATE PALMOLIVE CO 27.03.78-US-890160

A96 P32 (16.07.79) A61f

Mfr. of a sanitary pad with a composite, absorbent filling is claimed. The filling is made by superimposing longitudinal strips, on the bottom a cotton wool sheet, next a lower layer of fluffly pulp with deep channels in its underside, then a sheet of ripple cloth. The ripple cloth is covered with an upper layer of fluffy pulp which, in turn is overlaid with a top cotton wool sheet.

The ripple cloth and pulp layers are secured between the cotton wool sheets which are knurled together along their longitudinal edges. Pad lengths are cut from the composite filling and form stamper. The upper cotton wool sheet is covered with waterproof film and the filling enclosed in a sheet of unwoven textile material.

The prod. has a very high liq. absorption rate for peak discharges over short periods. This is combined with high retention capacity for liq. over long periods. 26.3.79 as 875098 (10pp448)

G02 (D23) (18.09.79) C07c-53 C07c-57 C07c-59

Linseed oil and boric acid are reacted by dissolving the acid in boiling water, combining the obtd. soln. with the oil maintained at 260-340°F., allowing the mixt. to cool and recovering the pptd. crystals. The wt. ratio of oil to water to acid is 6:6:1-12:12:1.

The reaction prod. is an effective emollient for treat
ment of skin burns and an oil-base paint extender. Whe
1oz. the prod. is added to a gallon of oil-base paint, the
paint is compatible with an additional gallon of water. T
extended paint gives good coverage while retaining colou
brilliance even under adverse weather conditions.

Coating metallic and nonmetallic prostheses with bioacti
substances - by coating the prosthesis with an enamel laye
incorporating the bioactive substances whilst it is viscous a
hardening
LEITZ WETZLAR E GMB 18.10.75-DT-546824
*M13 P32 + P42 (18.09.79) *BE-847-004 A61f-01/02*

Metallic or non-metallic prosthesis working pieces are provided with a coating of a bio-active material in a process not requiring high temp. treatment of the bio-active
material. The process comprises providing the prosthesis working piece with ≥1 inorganic enamel(-like) car
ier layer which is compatible with the body; the carrier layer is then converted into a viscous state.

The bio-active material particles are then incorporat
into the viscous carrier layer to form a coating layer comprising a multitude of areas of bio-active material ≥
1 partially embedded into the carrier layer; the carrier layer is then solidified.

The prosthesis parts formed have a satisfactory adhesive strength and coefficient of expansion, are free of pores, are highly corrosion resistant, and grow intimate
and firmly together with the bone tissue without using bon
cement. 18.10.76 as 733313 (4pp934)

Multicoloured candle cast in one mould - using cores of successively lecreasing sizes as inner moulds
FA KOCH P 16.02.77-OE-001047
*(20.09.79) *DT2806-182 C11c-05*
A technique for the production of multi-coloured candles in moulds in which former bodies are set whilst the space left free is filled with molten wax of different colours, eliminates the waste of time and the frequent damaging of the candles occurring in other methods.

The former bodies, of different sizes, are inserted one after the other in the cavity of the mould, and in each case, the available space is filled with molten wax before the next former body is inserted.

When the wax has set, the former body is extracted and the next former is put into the cavity left behind; the space between the already cast candle and the new former being filled with wax of a different colour. 14.2.78 as 806182 (4pp1045).

A cleaning compsn. which is liq. when free from water comprises an ethoxylate of an 8-20C alcohol contg. 3-15 ethylene oxide units per molecule and/or an ethoxylate of an alkylphenol, and an ethoxylate of a propoxylated propylene glycol.

The propoxylated propylene glycol moiety has a mol.wt. of 1,200-2,500, and its ethoxylate has 15-40 ethylene oxide units per molecule. Pref. the compsn. has 4-6 wt. pts. of alcohol- and/or alkylphenol ethoxylate and 1-3 wt. pts. propoxylated propylene glycol ethoxylate. The compsn. contains a hydrocarbon as a solvent.

The compsn. is esp. used for cleaning surfaces such as storage tank walls which are contaminated with hydrophobic materials such as hydrocarbon oils. 2.8.76 (7pp931)

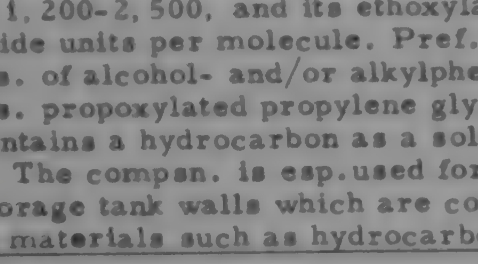
Pyrazoline cpds. of formula (I) are new:



(I)

In (I), Q is SO_2, $CH_2C(B_3)(XA)CH_2R_1$ (Ib) or $SO_2\text{-}C(B_1)(B_2)\text{-}C(B_3)(XA)\text{-}C(B_5)(R_1)\text{-}B_4$ (Ia). In (Ia), B_{1-5} are each H or 1-4C alkyl, R_1 is H, OH, or alkyl, R_2, R_3, R_5, R_6 and R_7 are each H, Cl, Br, F, (m)ethyl or (m)ethoxy; R_4 is H, alkyl, benzyl, phenylethyl or opt. substd. phenyl; X is -O-, -S-, $-NR_8-$, $-NR_8CO_2-$, $-O-SO_3-$, or $-SO_3-$; R_8 is H or opt. substd. alkyl; A is H, Na, K, opt. substd. ammonium or opt. substd. (cyclo)alkyl or ar(alk)yl; or NR_8 and A together are an opt. quaternised (un)satd. heterocyclic ring. Provisos are (i) that X is $-NR_8-$ only when R_1 is OH and (ii) that A is not H when X is -O-.

In (Ib), B_3 is H or 1-4C alkyl; R_1 is H, OH, or 1-4C alkyl; R_2, R_3, R_5, R_6 and R_7 are each H, Cl, Br, F, (m)ethyl or (m)ethoxy; R_4 is H, 1-4C alkyl, benzyl, phenylethyl or opt. substd. phenyl; X is -O-, -S-, $-NR_8-$, $-NR_8CO-$, $-NR_8SO_2-$, $-OSO_3-$, or $-SO_3-$; R_8 is H, 1-4C alkyl or 2-3C alkyl bearing OH or 1-4C alkoxy substit., and A is H, Na, K, ammonium, 1-8C alkyl or substd. 2-3C alkyl, cyclohexyl, benzyl, phenylethyl, phenyl or sulphophenyl; or NR_8 and A together are a 5-7 membered satd. heterocyclic ring with 1 or 2 heteroatoms selected from O, S and N.

(I) are useful as optical brighteners, esp. for cellulose esters, polyacrylonitrile, wool or polyamide. 30.7.76 as 031805 (+6.8.75-DT-535095) (-pp936)

SHEL D25 38473A/22 =GB 1553-386
Refining surface active agent streams - contg. water and non-surface active material, with sulphated or sulphonated organic material, by extn. with ketone or acetate as solvent
SHELL INT RES MIJ BV 30.11.76-GB-049831
*E19 (26.09.79) *BE-861-192 C07c-139/14*

Non-surface active material is extd. from a water/sulphated or sulphonated organic matter/non-surface active material feedstock by extracting the feedstock with a 4-10C ketone solvent at 60°C. or by using a 1-6C alkyl-acetate solvent.

A ketone or acetate/non-surface active material extract and a ketone or acetate/water/sulphated or sulphonated organic matter raffinate is formed in the extraction. Opt. the ketone or acetate may be sepd. from the extract and/or raffinate. Pref. the ketone is methyl isobutyl ketone, and the acetate is ethyl or isopropyl acetate.

The process is esp. used where the feedstock compri
300-1,000 wt.% of water w.r.t. wt. of sulphated or sul-
phonated organic material, and the amt. of sulphated/sul
phonated organic material is 5-25 wt.% w.r.t. the feedstock. 28.11.77 (4pp931)

INTE- D25 43394Y/25 =GB 1553-50
Stabilised sodium percarbonate mfr. - by precipitating in presenc
of silicate, then increasing the silicate content of the mother liquor
INTEROX CHEM LTD 01.08.75-GB-032185 (13.05.75-GB-020032)
*E34 (26.09.79) *BE-849-370 C01b-15/10*

Sodium percarbonate is pptd. from a silicate-contg. soln
yielding a particulate ppte. incorporating a restricted amt. of silicate within and throughout the particles; an amt. of silicate is then deposited on the surface of the pa
ticles to ameliorate the rate of decomposition of the prod
induced by external contaminants.

Pref. the soln. from which the prod. is pptd. contain
silicate in an initial concn. of 0.3-2.0% gpl. The silicate
(calculated as SiO_2) incorporated during pptn. is 0.1-0.4 wt.%.

The sodium percarbonate prepd. may be used in deter
gent compsns., even after prolonged storage. The prod. is stabilised against the adsorption of moisture from the environment, and reaction with the handling equipment. 11.8.76 (8pp931)

MORI/ ★ D25 70429B/39 ★J5 4049-98
Prodn. of liq. surfactant compsn. for dry-cleaning - by addin
alkylbenzene sulphonic acid(s) to surfactant(s) and opt. addin
alkali dissolved in ether
MORI Z 28.09.77-JA-117240
E19 G04 (19.04.79) C11d-01/14 C11d-03/02

The process is effected by adding opt. branched alkylbenzenesulphonic acid(s) to surfactant(s), and opt further ad
-ing dissolved alkali sol. in monobutylether or monoethyl
-ther or monomethylether of ethylene glycol.

The surfactant compsns. may be used combined with perchloroethylene or petroleum series solvents, and is useful for dry-cleaning. In an example 14 grams of KOH were added to 230 g of ethylene glycol monobutylether, ar
stirred for 30 mins. The resulting soln. was cooled and 140 g of dodecylbenzenesulphonic acid added. To the soln
were added 506g of polyoxyethylenenonylphenolether and further 110 g of alkylolamide. 10 grams of the soln. wer
added to 1 l of perchloroethylene and 1 l of New Solvent K
(RTM). In both cases the resultant was stable transparen
soln. 28.9.77 as 117240(4pp96)

NAKA- ★ D25 70718B/39 ★J5 4105-10
Washing process for oil removal - using sodium (N)-dodecy
benzenesulphonate in the presence of acetic acid
NAKANO SUMISE KK 07.02.78-JA-011956
E19 (17.08.79) C11d-03/20

In washing a substance soiled by oil using sodium n-dodec
-ylbenzenesulphonate (I) or a washing agent contg. (I), the improvement comprises diluting (I) or the washing agent with water, and adding acetic acid to the dil. soln. in an amt. to provide a concn. of 0.4-3.0 wt.%.

In one example, 2.5 g of sodium n-dodecylbenzene sul
phonate was diluted with water 1200 times to obtain 31
of a dil. soln. thereof. 1% of acetic acid was added to the dil. soln. to obtain a washing soln. Dishes dirty with oil were immersed in the washing soln., washed therewith, purified with water, and dried. As the result of it, the oi
could be completely removed from the dishes. 7.2.78 as 011956 (3pp51)

LIOY ★ D25 70971B/39 ★J5 4106-50
granular cleaner prodn. - includes forming alkali silicate-surfactan
slurry; mixing with acidic surface active agent, adding remainin
silicate, spray drying
LION FAT & OIL KK 10.02.78-JA-013404
E19 (E37) (21.08.79) C11d-11/02

A granular cleaner contg. 15-40 wt % of a surface active agent, 5-20 wt % of a alkali silicate and < 12 wt % of a phosphate (by P_2O_5 base) is prepd. by producing a slurry contg. a part or all of the surface active agent (i.e. an anionic agent, or anionic agent and nonionic and/or ampho
-eric agent), and an alkali silicate, (which has a 1.8-3.

olar ratio of SiO_2/M_2O where M is alkali metal). The lurry is mixed with 0.47-0.58 eqv. of an acidic surface ctive agent (e.g. alkylbenzenesulphonic acid, alkylsulphur ic acid), or an organic acid (e.g. citric acid, malic acid, artaric acid) per mol of SiO_2 in the slurry, and the mola atio of SiO_2/M_2O (where M is an alkali metal) of alkali ilicate in the slurry is regulated to 4.6-6.0. The rest o he alkali silicate is added to the slurry so that the molar atio of SiO_2/M_2O of the alkali silicate is 2.8-3.8. The lurry is then spray-dried.

The granular cleaner has a low phosphate content fav- ourable granular strength, high resistance to solidification lue to pressure and moisture, good fluidity and a low con- ent of insoluble matter.

The raising of the molar ratio of SiO_2/M_2O of the alkali silicate dissolved in the slurry is very importanrt and if t is omitted, the desired granularcleaner cannot be obtd. although the molar ratio of SiO_2/M_2O of the final prod. may be adjusted to 2.8-3.8. 10.2.78 as 013404 (6pp170)

NIHS D25 07475A/04 = J7 9025-930

Non-polluting detergent for the home - contains a fatty acid ester of tarch sugar

NIPPON SURFACTANT KK 04.06.76-JA-065823

*E13 (31.08.79) *J52148-510 C11d-01/66*

The detergent contains fatty acid ester of starch sugar, consisting of maltose and maltriose with 8-24C fatty acid, and fatty acid ester of polyhydric alcohol which is used as a food additive. The fatty acid esters of starch sugar have high compatibility with other surfactants. The detergent effect of the prod. is further improved by the synergetic effect of fatty acid ester of polyhydric alcohol. Since all of the materials are used as food additives, the detergent may be used for tableware.

The starch sugar is obtd. by the enzymatic decomposition of naturally occurring starch. A range of starch sugar with good dispersibility and ageing by the molecular rearrangement pref. comprises 0-10% glucose, 50-95% maltose, 5-40% maltriose and 0-5% of other components. The solubility in water of fatty acid ester of starch sugar is higher, the smaller the number of C atoms and degree of esterification; and the emulsifying power is higher, when the number of C atoms is 16-18. Superior detergency may be attained by using 12-14C fatty acid, or a fatty acid having longer chain (16-18C) with shorter chain. Pref. polyhydric alcohol is glycerin, propylene glycol, or sorbitan. 4.6.76 as 065823 C11d-1/66 (31.8.79) NIPPON SURFACTANT KK (NISH-) (5pp) (J52148510)

KAOS D25 47790Y/27 = J7 9026-232

Liq. bleaching agent compsn. - comprising sodium hypochlorite, alkali and nonionic polyethylene oxide

KAO SOAP KK 19.11.75-JA-139091

*A97 E34 F06 (A25) (03.09.79) *J52063-184 C11d-07/54*

Compsns. contg. Na hypochlorite do not deteriorate in fluorescent intensity and do not ppte. out etc. over long periods of time.

This is achieved by preparing compsns. contg. Na hypochlorite 3-7 wt.% alkali 0.1-2 wt.% and cpds. including nonionic polyethylene oxide, 0.01-1 wt.%.

The added alkali quantity is pref. 0.1-2 wt.% esp. 0.5-1 wt.%. When the alkali content is $<0.1\%$, the stability of the Na hypochlorite is not sufficiently retained. When it is $> 2\%$, the bleaching effect decreases undesirably because the pH becomes too high. The added quantity of cpds. contg. nonionic polyethylene oxide is pref. 0.01-1 wt.% esp. 0.05-0.5 wt.%. When it is $> 0.01\%$ it is not sufficiently effective to prevent deterioration of fluorescent intensity. When it is $<1\%$, the Na hypochlorite stability is reduced.

Anionic surfactant or anti-chlorine property and amphoteric surfactant can be added at need. Using these liq. bleaching agents, cloths of high whiteness are obtainable without deterioration of intensity of the fluorescent dyes used. 19.11.75 as 139091 C11d-7/54 (3.9.79) KAO SOAP KK (3pp) (J52063184)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240

Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

WERN D11 76009X/41 =DS 2512-790
Braided bread dough structure prodn - for subsequent baking from dough extrusion
WERNER & PFLEIDERER 22.03.75-DT-512790
*(27.09.79) *DT2512-790 A21c-05*

In the prepn. of strands of dough for plaited pastry or pretzels the first stage is the sepn. of a lump of dough with the weight of the finished article. This piece of dough is treated in kneading, dough raising and long rolling stations in turn. After passing through calibration rollers which shape it to a rectangular section of precise length, a set of shaping/cutting rollers with two circular roll gaps divide the dough into two parallel strands.

A conveyor takes these to the plaiting and baking stations. The gentle treatment of the dough ensures that the finished articles have excellent quality and taste. 22.3.75 as 512790(4pp39)
as 512790(4pp39)

BONG- D11 77608Y/44 =DS 2731-812
Automatically retractable loading ramp for bakers ovens - allows effective sealing between door and lower edge or doorway
LES FILS BONGARD 18.02.77-FR-005332
*+Q77 (27.09.79) *BE-856-241 A21b-03 +A21c-13*

A ramp for the doors of baking ovens is actuated by a lug at the bottom of the door. When the door is opened, this lug acts against a roller and shifts a structure in the floor with two inclined tracks. The horizontal strip of the ramp which is guided in vertical guides is thereby lifted up to the door sill when its rollers are forced up the inclined tracks. A hinged flap on the horizontal strip forms a ramp for the carriage with the pastry.

This saves the seals of the door seals from premature wear. 14.7.77 as 731812(8pp39)

ROHW/ ★ D11 71958B/40 ★DT 2812-183
Addn. of cooked whole rice flour to white bread - gives better keeping properties and allows reduced fat content
ROHWER W 20.03.78-DT-812183
(27.09.79) A21d-13

White bread, short bread, fruit loaf, etc., are made from the usual wheat flour, water or milk, yeast, salt and other additives, with the addn. of 10-20% of the flour used of well swollen (cooked) whole rice flour.

Addn. of the cooked rice flour to ordinary white bread keeps it fresh and moist for longer periods without being sealed into foil, whilst addn. of the rice flour to shortbread, fruit loaf, etc., allows the fat content to be left out or severely reduced. 20.3.78 as 812183 (3pp513).

ULLM/ ★ D11 71961B/40 ★DT 2812-217
Push/in rack for baking tins - with supports punched out of side walls and bent horizontal
ULLMANN W 20.03.78-DT-812217
P25 (27.09.79) A21b-07 A47b-57/12

A push-in rack for plates, specially for baking tins in bakeries, consists of two parallel vertical carrier sheets which are assembled to a stable structure by cross plates on top and bottom. The supports for the baking tins are produced by punching rectangular horizontal flaps in regular distance from the side walls and by bending them inward to form horizontal ledges.

This greatly simplifies the manufacture of these push-in racks. 20.3.78 as 812217 (7pp39).

CARR/ ★ D11 72196B/40 ★FR 2412-269
Fruit cakes, esp. tarts and flaws - contg. berries, sugar and gelling agent with better storage properties
CARRON J 23.12.77-FR-039249
(24.08.79) A21d-13/08 A23l-01/06

Gateau formed from a paste covered with a filling of berries uses a filling having a refractive index of ≥60 which contains ≥30% berries, ≥60% of a cpd. from saccharase, glucose and sugars, and 1-10g/kg of a gelling agent.

The gelling agent is pref pectin in amt. 3-6 gm/kg. The pastry is pref. speckled, layered or short. The paste pref contains almonds as powder or extracts, esp. 1-2 spoons of bitter almond puree per kg of flour, it also pref contains cinnammon in amt. of 1 coffee spoon per kg of flour and also lemon. The gateau is pref. a filled tart.

Prods are tarts and flans. The filling enables better storage properties i.e. without wetting the pastry or without the fruit drying up on the surface. 23.12.77 as 039249 (5pp597)

RHEO- D11 54417Y/31 =GB 1553-635
Continuous dough roller for pastry and bread - has conveyor rollers beneath faster moving endless rolling out unit
RHEON AUTO MACH 27.01.76-JA-007648
*(03.10.79) *DT2703-331 A21c-03/02*

Dough is stretched on appts. which has stretching rollers which travel along an oval path; a dough transport conveyor disposed and spaced below the lower straight part of the oval path; drives to move the rollers and the transport conveyor in the same direction, and to rotate the rollers in the opposite direction in the area where the lower part of the path faces the conveyor.

The transport conveyor includes an intake endless belt, transport rollers downstream of the intake belt whose peripheral speeds are greater than those of the corresp. stretching rollers and the speed of the intake belt, but less than the speed of the stretching rollers around the oval path. 27.1.77. as 003422 (10pp1376)

CUCC/ ★ D11 B/40 ★IT 1032-575
Dough smoothing appts. - for round pizza prodn.
CUCCI B 19.02.75-IT-067426
(20.06.79) A21c

RIKV ★ D11 72890B/40 ★J5 4109-962
Stable L-ascorbic acid (salt) prodn. - involves coating with molten mixt. of fat and oil and sucrose ester of fatty acid, followed by pulverisation
RIKEN VITAMIN OIL KK 17.02.78-JA-017394
B03 C02 E13 (D13) (29.08.79) A61k-31/34 C07d-307/62

Method comprises coating L-ascorbic acid or its salts with a molten mixt. of fat and oil whose m. pt. is 50-80 °C and sucrose ester of fatty acid by mixing them, followed by subjecting the mixt. to pulverisation.

The L-ascorbic acid or its salts in a form of pharmaceutical preparation are pref. used for bread- baking, and they can also be used for an assorted feed for fish-farming or general feedstuff.

The amt. of sucrose fatty acid is pref. 0.1-1 pt. wt. per pt. wt. of the fat and oil. The coating material is pref. used in a ratio of 1-20 times (weight) as much as the L-ascorbic acid or its salts. Sucrose fatty ester employed is an ester between sucrose and fatty acid, whose HLB is relatively low. 17.2.78 as 017394 (5pp75)

KANF ★ D11 72974B/40 ★J7 9027-422
Prepn. of oil and fat prod. for cakes - by mixing sugar fatty acid ester, polyvalent alcohol, unsatd. fatty acid mono:glyceride and hydrophobic sugar fatty acid, and emulsifying
KANEGAFUCHI CHEM KK 23.06.71-JA-045925
(10.09.79) A21d-02

Hydrophilic sugar fatty acid ester and polyvalent alcohol are used as aqueous phase material, and unsatd. fatty acid monoglyceride as well as hydrophobic sugar fatty acid are used as the organic phase material, and both are mixed and further mixed with vegetable oil, whereby the whole phases are emulsified. The resultant is useful for preparation of cake. 23.6.71 as 045925 A21d -2/00 (10.9.79) KANEGAFUCHI CHEM KK (8pp22)(J48010264)

TOXN ★ D11 73008B/40 ★J7 9027-885

Antibacterial treatment of bread or wheat flour - using compsn. contg. sodium acetate and sodium and/or potassium metaphosphate and/or glucono-(delta -lactone

TOYO JOZO KK 20.12.72-JA-127914

(12.09.79) A21d-02/14 A231-01/17 A231-03/34

Process comprises blending an antibacterial compsn. comprising 1 pt. wt. Na acetate and 0. 7 pt. wt. Na metaphosphate, K metal-phosphate and/or glucono-(delta)-lactone, with bread or wheat flour.

Process has no adverse effect on the quality or flavour of the prod. 20. 12. 72 as 127914 A21d-2/14, A231-1/176 3/34 (12. 9. 79) TOYO BREWING KK (4pp15)(J49085257)

KAOS D11 53230X/28 = J7 9027-886

Bread qualities improving agent - dessicated coconut powder treated with oleophilic, edible surfactant

KAO SOAP KK 20.11.74-JA-133439

*(12.09.79) *J51061-656 A21d-02/36*

Novel bread improver charging the inner structure, volume and taste of bread is obtained by coating desiccated coconut powder with oleophilic edible surfactant. In this prepn. desiccated coconut powder is mixed with lesser amount below 70°C and above the temp. at which the oleophilic surfactant is semisolid.

As a result of coating the surface of desiccated coconut powder with oleophilic edible surfactant, preservability of the bread improver is improved. By mixing the bread improver with dough, original fragrance of bread is enhanced and taste is improved. 20. 11. 74 as 133439 A21d-2/36 (12. 9. 79) KOA SOAP KK (4pp)(J51061666)

SHUR/ ★ D11 73293B/40 ★SU -641-406

Liquid ingredients dispenser for yeast prepn. - has receptacle with lower and upper sensors connected across amplifiers to AND/gates

SHURIK L N 31.08.76-SU-396775

R13 R26 (08.01.79) G01g-11 G05d-07/06

Known circuitry contained upper and lower sensors, receptacle, filling and emptying valves, pipes and commutators. Now amplifiers, thyristor switches, NOT-gates AND-gates and memories are introduced for greater accuracy and reliability.

Proposed dispenser can be used in bread baking and confectionery industry for dispensing liquids in yeast prepn. Reliability is increased partly by using the amplifiers to avoid oxidation of the sensors, and partly by use of contactless parts. The latter also increases accuracy of dispensing.

Shurik, L. N., Sivshev, V. B., Shtukarev, Yu. S. Bul. 1/5. 1. 79. 31. 8. 76. as 396775 (3pp840)

D12: MEAT; FISH PROCESSING

BAUE/ ★ D12 71980B/40 ★DT 2812-536

Double screw meat mincing machine - with pressure sensitive speed control of feeder screw

BAUER W 22.03.78-DT-812536

P41 (27.09.79) B02c-18/30

A meat mincing machine consists of a horizontal worm conveyor at the bottom of a funnel, feeding a vertical worm conveyor to take the meat to the perforated discs and cutters. The vertical conveyor has a separate drive which runs continuously. The drive for the horizontal feeder conveyor is controlled by a pressure sensor in the space where both conveyors join, which varies the worm speed infinitely variably, or in steps, or by switching OFF and ON. An alternative control is a load cell at the free end of the axially movable horizontal screw shaft.

This prevents the squashing of any excess meat supplied which would make it unsuitable for good quality sausage. 22. 3. 78 as 812536 (8pp39).

TURR/ ★ D12 72062B/40 ★DT 2909-791

Sausage string knotting attachment - with tubular corkscrew and retraction rod

TURROQUES G A 14.03.78-FR-007254

Q31 (27.09.79) A22c-11/12 B65b-51/08

A string is tied into a knot to close a sausage skin end or lumps of meat by passing the string through a corkscrew tube and pulling it through over the outside and then the inside of the corkscrew turns. The corkscrew is then turned around its axis and pulled back to form a tight knot.

This is a simple attachment for the automatic application of any desired number of knots and loops. 13. 3. 79 as 909791 (27pp39).

SAUR/ ★ D12 72187B/40 ★EP ---4-502

Prodn. of sausages etc. with different internal portion - by coaxial extrusion, with inner paste thickened to prevent its escape

SAURIN W 28.02.79-FR-005223 (17.03.78-FR-007863)

(03.10.79) A22c-11

D/S: E(BE, CH, DT, GB, IT, LU, NL, SW).

Prodn. of stuffed prods. consisting of two different, cylindrical, coaxial parts, comprises first coaxially extruding two cylinders of different pastes, of indefinite length, in a casing. The extrudate is divided up into the required lengths, each length having closed ends, then subjected to protein-coagulation and opt. peeling to remove the casing.

The new feature is that the consistency of the paste for the inner portion is thickened so as to prevent its escape from the outer portion at the ends of the prod.

An appts. for this process is also claimed.

The process is esp. for making sausages etc. based on meat or fish; particularly cocktail-type sausages. 14.3.79 as 400168 (18pp1251)

(F) ISR: ——

FUTA- ★ D12 72503B/40 ★J5 4107-548

Dried poultry meat prepn. - by soaking in alkaline soln., steaming, removing skin, removing the meat, seasoning, adding surfactant and drying

FUTABA BUSSAN KK 30.06.77-JA-078373

(23.08.79) A231-01/31

Prodn. of dried poultry meat (I) comprises (i) soaking slaughtered poultry (II) in alkaline soln. contg. such a reagent as polyphosphate, Na_2CO_3, etc. (ii) steaming (II) at high temp. and under high pressure, until the temp. of (II) reaches 65-90°C, (iii) removing the skin (iv) taking the meat of (II) in form of fibrous pieces with roller or mixer, (v) seasoning the meat with hot seasoning-soup, to impregnate the soup into the meat, (vi) mixing the meat with surfactant and (vii) drying the meat until the moisture content in the meat is 7-18 wt. %.

(I) can be preserved for long period of time. The skin is easily removed after the treatment in step (i). The treatment of step (vi) prevents adhesion of the meat pieces with each other. The drying of the meat is carried out at 80-120°C by hot air or IR ray-irradiation. 30. 6. 77 as 078373 (3pp42)

DURA/ ★ D12 B/40 ★OE 7803-014

Lifting meat carcasses from suspension track - using frame with rollers which travel over curved guides with chain carcass-holder, until frame is horizontal

BELO MEAT IND RES 08 07.77-SU-505345

Q35 (16.01.79) A22b-07 B65g-65

Device for removing meat carcasses from a suspension rack on which they are being carried, includes a mech- nism for feeding the carcasses individually and mechan- sm to lower the carcasses, comprising a frame and a rive. Reliability is increased and construction is simp- ified by fitting the lowering mechanism with arc-shaped uides. A frame is positioned so that it can rotate and s fitted with rollers which interact with the guides.

The end of the track on which the suspended carcasses are moving runs into the end of the portion of track where he motion stops. The trolleys travel on to the latter section, an electric motor is switched on and its rotary motion is transmitted to the lowering frame. The rollers on the frame travel over the arc-shaped guides. A tie-piece (consisting of a chain) holds the lower end of the carcasses in the plane of the frame and, when the latter has moved down far enough to be in a horizontal position, the carcass is removed. The device can also be used in the reverse way, i.e., for loading carcasses on to the suspension track.

Removing epiphysis from bones - by fastening bones to a rotor and bringing into zones of disc saws

LENGD MEAT IND TRUS 25.07.77-SU-571454

(16.01.79) A22c-17

Device for remaining epiphyses from tubular bones, in the meat industry, according to Parent Cert. No. 384502, comprised disc saws with identical diameters mounted vertical and parallel, and displaced relative to one another, and a rotor with bone-holding mechanisms fastened to its surface radially, and which could move backwards and forwards relative to the saws.

Now the noise level is reduced by mounting a spring-loaded catches in the decanting zone, with the saws and template for setting the position of the roller being fitted respectively with a pneumatic damper and guides. The bone-holding mechanisms are also spring-loaded.

Shkurat, V.P., Pavlov, M.S., Merzlikin, V.A. Bul. 2/15.1.79. 25.7.77. as 511454 Add to 384502 (4pp29)

Reducing friction coefficient of regenerated cellulose sausage skins - by applying an aq. dispersion contg. a friction reducing cpd. giving improved results in high speed filling machines

TEE PAK INC 29.04.76-US-681625

*A97 +P42 Q34 (A11 A25) (25.09.79) *BE-852-489 A22c-11 A22c-13 B65d-81/34*

Linked meat-filled sausage casings of regenerated cellulose are prepd. having uniform dimensional characteristics. In the process, an aq. dispersion contg. a water-soluble cellulose ether and 0.25-1.0 wt.% of an alkylene oxide adduct of a partial fatty acid ester are applied to the external walls of the casing.

The cellulose ether used imparts a low coefficient of friction to the casing, being present at a concn. of 0.25-1.0 wt.% and applied to the wall in proportion 0.25-1.0 mg/in^2 of external casing. The casing is filled with a meat emulsion after the dispersion is applied, and the filled casing linked.

The process avoids the prodn. of oversized chubs, reducing the number of oversize sausage links on stuffing and linking. 29.4.76 as 681625 (3pp931)

13/06 B02c-19/12

A machine for the mechanical preparation and dehydrati
of straw and stalks treats the charge continuously in an
ultra-frequent compression-expansion process. Solids
and liquid are finally separated in a centrifugal field.

Two parallel worm conveyors pref. take the material
to a space where foreign matter can accumulate and, wh
the pressure becomes excessive, burst a shear pin to be
discharged. A limit switch cuts off the drive; a second
one responds when the tunnel is overfull.

This machine combines a higher efficiency with a smaller constructional effort and a lower power consump
tion.

The crushing section consists of a rotor with the impa
tools and a split stator with two halves and ribs. Transfer slots move the material to the centrifuge on the same
drive shaft.

The blades of the centrifuge are preceded by guide discs. Liquid and solid residue are discharged through separate channels. 14.3.78 as 810944 (9pp39).

MORINAGA MILK KK 13.02.78-JA-014120
(23.08.79) A23c-19

Prodn. of cottage cheese-like food (I), comprises (1) forming curd by the addn. of lactic acid bacteria or coagulating agent (II) to milk or mixt. of milk (III) and soybean milk (IV) after sterilisation and cooling, (2) dehydrating the curd, to adjust the moisture content to 16.5-25.0 wt. % (3) adding 0.1-1.0 wt. % of low methoxylated pectin, (4) filling the mixt. in a vessel and (5) heating the mixt.

(I) can be preserved for long period. (I) has appearance of tofu (soy bean curd) and cottage cheese-like taste. Pref. (III) is whole milk, defatted milk, condensed milk, etc. When (III) and (IV) are used as raw materials, the quantity of solid in (IV) should be < 25 wt. % based on the sum of the solid in (III) and (IV). Examples of (II) are calcium sulphate, organic acid, gluconodelta lactone, etc. 13. 2. 78 as 014120 (13pp42)

JAOR ★ D13 72505B/40 ★ J5 4107-560
Gelling agent prodn. for food - by mixing a gelatin soln. and carrageenan soln., and drying
JAPAN ORGANO KK (NOSU-) 08.02.78-JA-012287
(23.08.79) A23l-01/04

Prodn. of gelling agent (I) for food, comprises (1) mixing 3-40 wt. % gelatin soln. (II) and 2-10 wt. % carrageenan soln. (III), in the wt. ratio of (II)/(III) = 3/1-10/1, to prepare a clear soln., and (2) drying the soln.

(I) has high solubility, high solidifying temp., short solidifying time, high jelly-strength, high nutritive value and good texture.

(II) and (III) are mixed in relatively high temp., cooled to 40-60°C, spread on a plate or vat, solidified by cooling and then dried. The dried product is ground to powder or granule, as required. When a small amt. of natural gas is added to the mixt. of (II) and (III), the texture of foods produced from (I) can be improved. In this case, 1-5 wt. % natural gum soln. is mixed with the mixt. of (II) and (III), where the wt. ratio of the amt. of natural gum soln. to the amt. of the mixt. of (II) and (III) should be 1/5-1/20. 8. 2. 78 as 012287 (5pp42)

Fibrous proteinaceous food prodn. - by kneading protein-contg. material with water, applying shearing stress to mixt., heating and sepg. using roller
AJINOMOTO KK 10.06.76-JA-067983
*(12.09.79) *J52151-756 + A23j-03*

Prepn. of fibrous proteinous food material comprises kneading a protein-contg. substance with water, applying shearing stress to the mixt. while heating in a plasticised condition to orient protein molecules and sepg. it as fibres with a roller. Fibrous food material, having desirable meat-like effect can be prepd. economically

As starting protein-contg. substance vegetable proteins such as oily seeds (e.g. defatted product or separated protein of soy bean, peanut, cotton seed, etc.), grain protein (e.g. wheat glutan, corn gluten, etc.). animal protein and microbial protein can be used and they may contain $<$60% of nonprotein material. To this 20-65% (pref. 30-65%) of water is added and mixed homogeneously. The mixture is then heated to 80-250°C (pref. 100-200°C) at $<$500 psi (pref. 100-350 psi).

Orientation of the mixt. under heating and pressure, can be practiced with an extruder. It is important to regulate the condition so that obtd. sheet or bar material is not swelled (pref. $<$10%). Sheet material is sepd. into thin long fibres with sepg. roller, which has many file-like teeth on its surface. 10. 6. 76 as 067983 A23j-3/00 (12. 9. 79) AJINOMOTO KK (3pp)(J52151756)

MILE D13 00037Y/01 = J7 9027-889
Textured protein concentrate as meat substitute - prepd. by aq. extn. of extruded protein to improve flavour and texture
MILES LABORATORIES INC 15.09.75-US-613090
*(D12) (12.09.79) *BE-845-331 A23j-03*

Prepn. of a concentrate of textured proteins from a protein extrudate contg. water-soluble constituents is claimed. The protein extrudate of mass/vol. ratio 85-150 g/1 (esp. 90-115g/1) is extracted with an aq. solvent ar pH 5. 5-6 (esp. pH 5. 7).

Texture protein, esp. soya protein, is used as a meat substitute in various meat prepns. The crude protein contains carbon hydrates and salts which adversely affect the taste and smell of the prod. The process provides a cheap way of improving the texture and taste of the prod. so that it more closely resembles meat enabling more to be used. 10. 9. 76 as 107972 (clg. 15. 9. 75-US-613090) A23j-3/00 (12. 9. 79) MILES LABORATORIES INC (7pp)(J52041261)

Granulated animal feed concentrate prodn. - includes forming protective coating in soln. of cellulose derivs. in acetone or dioxan, with addn. of mineral oils to improve storability
MEDICAL ENG RES INS (LIVA= MICR=) 28.06.76-SU-376003
A97 C03 (15.05.79) A23k-01

Particles of feed concentrates can be provided with protective coatings by dispersing them in a polymer soln, and then expelling the solvent.

The storage properties and esp. the flowability of the product is improved by introducing into the polymer soln. a nonpolar oil, expelling the solvent and, prior to drying, washing the product with a solvent for the nonpolar oil. The method can be used for preservation of hygroscopic feed concentrates contg. amino acids, enzymes, vitamins etc.

The pref. polymers are cellulose derivs. in particular acetylcellulose or cellulose acetophthalate, acetopropionate or acetobutyrate; the substitution degree is 1. 3-2. 5; the amount is 3. 0-15. 0 wt. % w.r.t. the total solids. The pref. nonpolar oils are vaseline or silicone oils. The pref. polymer solvents are acetone and dioxane; the soln. contains 1. 0-10. 0% of the polymer. The pref. solvents for the nonpolar oils are low-boiling fractions of petroleum ether and hexane.

Meat analogues contg. no spun protein fibres - having lean and fatty phases, esp. simulating bacon

GENERAL FOODS CORP 01.10.74-US-510879 (22.03.72-US-236982)

(D12) (25.09.79) A23l-01/27

A bacon analogue comprises "fat" regions contg. fat, albumen and water, and "lean" regions contg. 10-25 pts. fat, ⩽ 15 pts. albumen, 6-25 pts. vegetable protein isolate, 0-15 pts. ground proteinaceous filler, ⩽15 pts. colouring and flavouring and 40-65 pts. water. The albumen and fat contents of the fat regions are greater, and the water content is lower, than those of the lean regions.

When fried, the prod. crinkles, resembling bacon. The fat regions have a mouth-feel like bacon fat. The lean regions have a meat-like texture although no protein fibres are used. 1.10.74 as 510879 C.i.p. 3840677 (8pp)

DAYL- ★ D13 73553B/40 ★US 4169-162

Soft moist heat treated food for zoo animals - contains proteinaceous material and colloidal clay with antimicrobial agent as preservative

DAYLIN INC 20.04.78-US-898164

C03 (25.09.79) A23k-01/10

Soft-moist heat treated animal food of pH 4-6, comprises 40-65 wt.% moist proteinaceous meaty material, 1-14 wt.% proteinaceous vegetable material, 0.75 - 3.5 wt.% colloidal clay and 40-70 wt.% moisture. It is stabilised microbiologically by combining the clay with an antimicrobial agent.

Partic. useful for zoo animals with the advantage over carcass meat, in that it is more stable and vitamins and minerals can be evenly distributed throughout it. 20.4.78 as 898164 (6pp916)

HILB ★ D13 73554B/40 ★US 4169-164

Coffee bean roasting process - with two separate drying stages using fluidising gases at differing temps. and velocities

HILLS BROS COFFEE INC 23.12.77-US-863724

(25.09.79) A23f-01/02

Continuous dry roasting of green coffee beams is effected by progressively and continuously moving and agitating dry green coffee beans in a fluidised bed successively through first and second separate roasting chambers. In the first chamber the beans are contacted with a dry high velocity gas which fluidises the beans. The gas temp. is 440-470°F. This effects a partial roasting of the beans and expansion of the cellular structure.

In the second chamber the beans are contacted with an independant dry roasting gas stream which fluidises the beans. This gas stream is at a lower velocity and higher temp. than the first stream. This stabilises the open structure of the beans and darkens them without burning them. The temp. is 515-545°F. The beans are finally cooled.

Method produces a high soluble solids yield, low density, roasted coffee prod. 23.12.77 as 863724 (6pp295)

Diced hot banana peppers prodn. - by flattening, cutting into dices and screening to remove seeds and pulp

VERI V J 20.04.78-US-898393

(25.09.79) A23l-01/21

Prodn. of diced hot banana peppers comprises removing the stems, flattening the peppers and cutting the resulting flattened peppers. The cutting is first done to produce strips by using rotating circular blades, and then cutting the strips into squares using cross cut knives mounted on a rotating spindle.:

The cross cut knives throw the cut squares upwardly and outwardly against a discharge chute. The impact of the cutting devices loosens the pulp and seeds from the cut squares. The resulting mixture of diced flesh, pulp and seeds are passed into one end of a rotating cylindrical screen which passes the seeds and pulp and retains the diced flesh. Pref. the cylindrical screen has a mesh of $^1/_4$ - $\frac{1}{2}$ inch. The rotating spindle for the cross cut knives pref. rotates at ⩾2,000 rpm.

The method is used to prepare diced peppers which may be preserved by either freezing or pickling. 20.4.78 as 898393 (4pp295)

BEEC- ★ D13 73556B/40 ★US 4169-166

Potato mash prodn. - from unpelled cooked potato pieces transported under pressure along perforated conduit

BEEHIVE MACH INC 03.01.78-US-866242

(25.09.79) A23l-01/21

A potato mash is produced from cooked unpeeled potatoes by feeding the potato pieces continuously into one end of a perforated circuit. The perforations are sized to prevent the passage of potato skin, eyes or hard defective flesh.

The potato pieces and debris are transported along the conduit by a coaxial conveyor screw. Pressure is exerted on the potato pieces as they are transported along the conduit. Mashed flesh is discharged through the conduit perforations while skin, eyes and hard defective flesh is discharged from the opposite end of the conduit. The pressure on the potato pieces is maintained by holding the rate of discharge less than the transportation rate along the conduit.

Method is used to produce a mashed potato product which may be eaten directly or passed over drying rollers to yield a dehydrated product. The resulting mash has a better potato flavour than previous products, and also waste is minimised and thus the process is economical. 3.1.78 as 866242 (3pp295)

Conveyor forming of meat olive, tortilla etc. - by mechanically folding flaps of casing sheet over stuffing then rolling
BAMACH BV 26.05.78-NL-005735
(17.09.79) A23p

Process for forming a meat olive or similar food prod. comprising a stuffing rolled up in an edible covering sheet is claimed. The initially flat sheet is wider at its leading edge. A length of stuffing, shorter than the leading edge, of the sheet, is laid centrally along that edge to leave wings of the sheet extending symmetrically beyond both ends of the stuffing. The wings are folded upwards around the ends and over the top of the stuffing. The leading edge of the sheet is then rolled upwards towards the trailing edge so that the stuffing is rolled up in the sheet.

The sheet can be triangular but is pref. 'T'-shaped, the cross bar of the 'T' forming the leading edge while the trailing edge is approx. equal in length to the stuffing.

Used for mfg. meat olives, tortillas, cannelonis, and similar stuffed roll food prods. Mechanisation of a previously manual series of operations.. Improved control of prod. shape and size facilitates handling and packing.

Mono:karyons prodn. from di:karyotic Basidiomycetes strains - by culturing hyphal fragments on glycine contg. soln.

EGER G 29.03.78-DT-813521
(28.09.79) C12k

Prodn. of monocaryons from dicaryotic stains of Basidiomycetes comprises first fragmenting the mycelium in aq. medium to give viable hyphal fragments mostly having one hyphal compartment with a frew having on very small no of dedicaryotisation soln. contg. glycine and ≥1 C source so that they develop into separate mycelial pellets always covered by ≥2 mm depth of liq.

The degree of dedicaryotisation of the pellets is determined microscopically then (c) the pellets fragmented in aq. medium to five fragments contg. one or very few cells. These are (d) placed on a nutrient gelose plate so as to form separate colonies then (e) those colonies found to be monocaryotic are transferred to a fresh medium.

The monocaryons can be repaired with selected partners to give new dicaryotic strains having controlled characteristics e.g. non-sporulating strains of edible mushrooms. Method can be used to identify particular dicaryotic strains. Method is rapid, gives high and reproducible yields of monocaryons without alterations to the genes and does not require expensive equipment or special personnel. 28.3.79 as 875161 (28pp1251)

DHVR- ★ D15 71739B/40 ★BE-876-331

Lowering the phosphate content of effluent water - by adding a reagent forming sparingly soluble phosphate(s) and contacting with a fluidised bed of granular crystallisation promoter

DHV RAADGEVEND INGE 18.05.78-NL-005358
(17.09.79) C02b C02c

In a process for chemically lowering the phosphate content of water, a reagent (I) is added which forms a difficultly-soluble phosphate, and the liq. is then contacted with a granular crystallisation-promoting seed material (II). The (II) is maintained in a fluidized state in the water stream, while addn. of (I) is carried out in such a way that complete heterogeneous nucleation takes place on (II).

The process gives good removal of phosphate, e.g. from effluent waters, by promoting crystallisation of calcium phosphate cpds. The treated water has a low phosphate content and is suitable for biological treatment. The process operates without introducing large amts. of salts into the water. The fluidised bed of (II) presents a large crystallisation surface, so that short contact times can be used, and the size of the appts. can be reduced. Stoppage of the crystallisation bed is avoided. The spent crystallisation material has a low water content (0.5%) and is a useful industrial and agricultural material. 17.5.79 as 876331 (19pp513)

DEUT/ ★ D15 71830B/40 ★BE-876-657

Microporous element promoting fluid flow without pumping - to vent fermentation reaction and to purify industrial effluent liq. or gas

DEUTSCH D H 30.05.78-US-910110
J01 (D16) (17.09.79) B01d C12k

A microporous element comprises several layers of material which is relatively impermeable to fluids, each layer being perforated with tapering passages which connect in series from layer to layer. All the passages in all layers taper in the same direction towards the first face of the element. To pass through the element a fluid must make its way through not less than three and not more than 10,000,000 passages.

The overall thickness of the element is 0.001 μ -100 cm. The average distance across the bigger end of each passage is 0.001-100 μ and the included angle of passage taper is 10-160°.

The average distance across the orifice which interconnects two passages is 0.0002-100 μ. At least 2 and <16 orifices interconnect each passage. The number of a symmetric pores per cm^2 of element face is 10-10^{14}. The element is pref. used to convey gas from one face to the other.

Used to produce a flow of gas or liq. through a conduit in which the microporous element is fitted, e.g. to purify industrial chimney exhaust fumes, to purify polluted industrial effluent, to promote a flow of air through the neck of a sterile flask in which a fermentation reaction is monitored for bacteriological research. The element is cheap, simple to use and promotes fluid flow without power pumping. 30.5.79 as 876657 (21pp448)

BACH/ ★ D15 72003B/40 ★DT 2812-794

Swimming pool water treatment - controls halogen and ozone addition by redox potential measurement

BACHHOFER B 23.03.78-DT-812794
(27.09.79) C02b-01/38

In a water treatment system for swimming pools the water in circulation receives an admixture of a halogen and is exposed to the action of ozone. During operation, the redox potential of the pool water is measured and the treatment plant is put into circuit automatically at certain intervals. When the redox potential rises to a preset value, it is cut out again.

This guarantees that the water is free from germs but that the treatment plant operates for a minimum of time. The operating costs are thus reduced. The amount of substances with an oxidation capacity is kept low enough not to molest the users of the pool. 23.3.78 as 812794 (14pp39).

MERE ★ D15 72006B/40 ★DT 2812-813

Biological sewage treatment - combines activated sludge with bio:adsorbent fluidised bed

MERCK PAT GMBH 23.03.78-DT-812813
(27.09.79) C02c-01/06

An activation process for use in the biological sewage treatment uses in addition to the activated sludge process a bioadsorbent in a fluidised bed inside the aeration tank. This reduces the concentration of substances of poor digestibility and eliminates the toxic effect on fish. The sludge properties are improved and/or the sewage can be bleached.

Specifically a first pipe is used for the sewage inflow and the sludge recycling. A second leads to the reclarification basin. The bioadsorbent (e.g. granulated activated carbon) in the fluidised bed is kept sepd. by two screen decks. 23.3.78 as 812813 (7pp39).

VEBB ★ D15 72042B/40 ★DT 2905-117

Electrochemical machining of metals - in appts. which is also used for inexpensive detoxication of neutral or basic electrolytes or their waste solns.

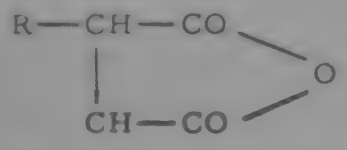
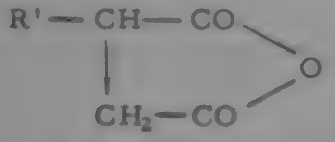
ICIL ★ D15 72160B/40 ★EP ---4-426
Surfactant compsn. for emulsifying oils in aq. media - comprises mixt. of high and low mol. wt. polyester(s) derived from alkyl or alkenyl succinic anhydride and poly:alkylene glycol
IMPERIAL CHEM INDS LTD 23.03.78-GB-011679
A25 H03 (A97 H08) (03.10.79) B01f-17/44 C08l-07 C10m-01/06
D/S: E(BE, DT, FR, GB, IT, LU, NL, SW).

Surfactant compsn. comprises (A) 5-95 wt. % of a polyester obtd. by condensing (a) an alk(en)yl succinic anhydride (I) of formula



(where R is (un)satd. hydrocarbyl derived from a polymer of a mono-olefin, the polymer chain contg. 40-500 C) and (b) a polyalkylene glycol of mol. wt. 400-20,000 which is $\geqslant$ 5 wt. % water-soluble at 25°C, the polyester so obtd. contg. 10-80, pref. 20-60 wt. % of residues of (b); and (B) 95-5 wt. % of a polyester obtd. by the condensation of (a) an alk(en)yl succinic anhydride (II) of formula



(where R' is 8-18 C alk(en)yl) and (b) a polyalkylene glycol of mol. wt. 200-4,000 which is $\geqslant$ 5 wt. % water-sol. at 25°C, the polyester so obtd. contg. 10-80 (pref. 20-60) wt.% of residues of (b).

The compsn. is useful as a surfactant in the emulsification of oils in aq. media (e.g. sea-water). Thus it can be used for treating oil slicks, or as an additive for cutting oils or fluids for hydraulic transmission.

The compsn. enables O/W emulsions to be produced under low energy conditions and at the same time confers a high degree of stability on the emulsions obtd. The combination of the two types of surfactant gives, at the same total concn. of surfactant, a lower oil-water interfacial tension than is given by either surfactant alone. 8.3.79 as 300355 (23pp914).

Chromium plating waste water treatment - by acidifying, adding waste photography developing or fixing soln., neutralising and filtering
MORI M 13.02.78-JA-015078
E31 G06 M11 (25.08.79) C02c-05/02 C25d-03/04

The method uses a developing soln. for photography. Chrome plating waste water is first regulated to pH < 3 by the addn. of an acid, e.g., H_2SO_4, etc., and then treated with a waste developing soln, a mixt. of waste developing soln. and waste fixing soln. for photography, opt. water-diluted, contg. sodium sulphite, sodium metabisulphate, acid sodium sulphite, menthol, hydroquinone, sodium carbonate, etc., at 10-60°C for 20-250 sec. in order to reduce hexavalent chromium ion to trivalent chromium ion; and neutralising to pH $\geqslant$ 7.0 to ppte. flocs which are in turn sepd. by filtration, etc.

The method can effectively treat chrome plating waste water simply and at lower cost, giving highly purified treated water and the hydroxide of trivalent chromium, which is usable as a tanning agent. 13. 2. 78 as 015078 (3pp117)

MITJ ★ D15 72690B/40 ★ J5 4108-461
Denitrification of waste water with high nitrogen content - by contact with oxygen and activated sludge in pressure vessel which causes forced circulating flow
MITSUI MIIKE MACH KK 15.02.78-JA-015331
(25.08.79) C02c-01/17

Waste water contg. large amt. of nitrogenous cpd., e.g. sewage, industrial effluents, etc., is contacted with O_2 and concd. activated sludge a pressure vessel provided with an inner cylinder with an axial flow impeller by which forced circulating flow is caused. The sludge present in the waste water thus treated is sepd. and concn. by a pressure floating method.

The waste water deprived of its floated sludge is contacted with concd. anaerobic sludge in the absence of oxygen in an ordinary pressure vessel provided with an inner cylinder with an axial flow impeller by which forced circulating flow is caused. The sludge present in waste water is sepd. and concd. by a pressure floating method.

This method is capable of treating nitrogenous cpds.-rich waste water with higher denitrification rate without causing bulking by using compact treatment facilities. 15. 2. 78 as 015331 (5pp117)

TORA ★ D15 72691B/40 ★ J5 4108-462
Treatment of waste water having high COD - by regulating ph to more than 12 and treating with oxygen-contg. gas in presence of catalyst contg. copper cpd.
TORAY IND INC 14.02.78-JA-015788
(25.08.79) C02c-05/04

The waste water is first regulated to pH > 12 and then treated with an oxygen-O_2-contg. gas in the presence of a catalyst composed of an alkali hydroxide soln. of a Cu cpd. e.g. $CuSO_4$, $Cu(NO_3)_2$, $CuCl_2$, $CuCO_3$, Cu acetate, $Cu(OH)_2$ etc. > 100°C and under a pressure high enough to keep part of water in a liq. phase.

The waste water thus treated is subjected to a vapour-liquid sepn. and the sepd. treated water is neutralised to form sediment of $Cu(OH)_2$ which is in turn recovered for reuse as catalyst.

The waste water contains large amts. of oxidisable substances which are easily convertable into free acids upon oxidn. e.g., organic cpds. or polymer contg. S, inorganic cpds., e.g., thiosulphates, sulphides, etc., organic cpds. or polymers contg. Cl.

This method is capable of effectively treating waste water contg. high concentrations of COD components without causing the erosion of treatment facilities. 14. 2. 78 as 015788 (4pp117)

MITR ★ D15 72692B/40 ★ J5 4108-4
Removal of harmful inorganic materials from water - by pass water through granular inorganic anion exchanger to remo arsenic ions etc., then regenerating the exchanger
MITSUBISHI RAYON KK 14.02.78-JA-016086
(25.08.79) B01d-15/04 C02c-05/08

Removal of harmful substances, e.g. arsenic, etc., par ic., from ground water, spring water, etc., is describ in which the water is contacted with a granular inorgani anion exchanger, prepd. by mixing and extruding a mixt. of $\geqslant$ 1 of the hydroxides of Ti, Zr, and Th, alumina sol. alumina gel, packed in a column, then a 0.1-40% basic substance soln. of NaOH, KOH, NH_3, Na_2CO_3, etc., is passed through the inorganic harmful substances, adsor ed granular inorganic anion exchanger for regeneration the anion exchanger and also the desorption of the harmf substances. An inorganic acid or its aq. soln is passed through the regenerated anion exchanger for the neutrali ation of residual basic substances present.

The method is capable of effectively removing harmfu inorganic substances, partic. arsenic acid ion, arseniou acid ion, etc. from water contg. chlorine ion, bromine ion, etc., selectively and with high efficiency over a long period at lower cost. 14. 2. 78 as 016086 (5pp117)

EBAI ★ D15 72824B/40 ★ J5 4109-24
Organic sludge, e.g. sewage, treatment - by making it alkaline an applying ionising radiation in presence of oxygen
EBARA INFILCO KK 16.02.78-JA-015867
K08 (27.08.79) C02c-03

Organic sludge is treated by making it alkaline (pref. to pH 9-14), and applying ionising radiations (e.g. γ-ray from a radioactive isotope or electron rays from an elect ron accelerator) to it in the presence of oxygen.

Insoluble organic substances such as bacteria, protozo polysaccharides, etc. contained in the organic sludge can be effectively solubilised. The solubilised liq. can be easily treated by a common biological treating process, or can be effectively reutilised as a hydrogen donor, in place of carbon cpds. such as methanol, in the denitrification of organic sewage. The solid matter remaining after the solubilisation exhibits improved dehydrability.

The alkali used for controlling the pH to 9-14 is pref. an inorganic alkali such as calcium hydroxide, sodium hydroxide, etc. The organic sludge is e.g. excess activated sludge formed in the biological treatment of city sewage or waste water from a food factory. 16. 2. 78 as 01586 (3pp50)

EBAI ★ D15 72825B/40 ★ J5 4109-245
Nitrogen contg. organic waste water treatment - includes applying ionising radiation to any excess sludge formed,and returning it to denitrification process
EBARA INFILCO KK 16.02.78-JA-015868
K08 (27.08.79) C02c-01/02 C02c-03

Nitrogen-contg. organic waste water is treated by applying ionising radiation to any excess sludge formed, and then returning it to a denitrifying process. The organic waste water contg. nitrogen cpds. and BOD substances is denitrified biologically.

Excess sludge formed in the biological denitrification treatment of nitrogen-contg. organic waste water, can be effectively utilised as a hydrogen donor, and denitrification can be very effectively achieved without using carbon cpds. such as methanol as hydrogen donors at all.

Ionising radiation is pref. γ-rays from radioactive isotopes or electron rays from the electron accdlerator. The solubilisation of organic substances in excess sludge by the application of ionising radiation can be further effectively accelerated by blowing oxygen into the sludge, making the sludge alkalinity > pH 8.0, or making the temp. of the sludge 50-100°C. 16. 2. 78 as 015868 (3pp50)

HITB ★ D15 72826B/40 ★ J5 4109-246
Water purificn. - comprises removing hexa methylene tetramine and phenol by adsorption using strong acidic cation exchange resin and activated carbon
HITACHI CHEMICAL KK 15.02.78-JA-016230
A91 E16 (E14) (27.08.79) C02c-05/08

Water is cleaned by removing hexamethylenetetramine and enol by adsorbing using a strong acidic cation-exchange esin and activated carbon.

By treating waste water contg. hexamethylenetetraam-e and phenol with both strong acidic cation-exchange esin and activated carbon, hexamethylenetetramine(hex-mine) and phenol can be effectively removed. Esp. when e exhaust water is treated with activated carbon and then ith a strong acidic cation-exchange resin, distinct remov ing effects can be obtd.

By using simultaneously activated carbon which can ad-orb phenol but does not adsorb hexamine, and strong cidic cation-exchange resin which can adsorb hexamine ut does not adsorb phenol, synergism can be obtd. The dsorbing treatment is carried out using a fixed bed of the dsorbing agents, a fluidised bed, etc. 15. 2. 78 as 016230 (5pp50)

Anaerobic fermentation of animal excreta - in collapsible bag filled to exclude air to produce methane and fertiliser
ALBERS T 18.08.78-US-934857
(25.09.79) C02c-01/14

Animal excreta is anaerobically fermented by receiving it in an open gutter where it is held until a predetermined portion of the excreta becomes liquefied. This liq. is drained off and delivered to one end of an elongated collapsible bag devoid of any significant quantity of air. A barrier is applied to the bag adjacent the inlet end of the bag to prevent the liq. excreta from flowing into the remainder of the bag. The barrier is moved along the length of the bag to allow it to become progressively filled.

The contents of the bag are maintained at a temp. conducive to fermentation and gases are vented. Liq. excreta is tapped off from the opposite end of the bag to the inlet after a predetermined degree of fermentation has occured.

The method is used to convert animal excreta into combustible gases and a fertiliser. The method is particularly useful for obtaining methane and a nitrogen-rich fertiliser from cattle excreta. 18. 8. 78 as 934857 (5pp295)

Regeneration of enzyme immobilisates - using salt soln. to desorb inactivated enzyme

DYNAMIT NOBEL AG 19.05.78-DT-821890

B04 (17.09.79) C12b

Regeneration of inactivated enzyme immobilisates comprises an enzyme immobilised on a support) is carried out by desorbing the inactivated enzyme with a soln. of a salt and treating the support with a fresh enzyme soln. The treatment removes the inactivated enzyme without impairing the immobilising power of the support.

The salt soln. is pref. a 10-40 (esp. 20-30) wt.% aq. soln. of $(NH_4)_2SO_4$, pref. buffered to pH 5-11 (esp. 7-9). Desorption is pref. followed by washing with a buffer soln. If the enzyme has already been desorbed during use, regeneration can be effected simply by washing and treating with fresh enzyme soln. The immobilisate pref. comprises an enzyme (esp. an acrylase) non-covalently bound to a support, e. g. by ionic attraction or adsorption. A pref. support comprises a mineral carrier treated with an alkoxy-silane contg. aminoalkyl or aminoaryl gps. 18. 5. 79 as 876354 (8pp367)

Preserving yeast culture during continuous alcoholic fermentation - using flocculating yeast which is removed by sedimentation and partly recycled

WAAGNER BIRO AG 19.05.78-OE-003665

(17.09.79) C12c

Method for preserving a yeast culture during continuous fermentation of a sugar-contg. wort for alcohol prodn., comprises using a flocculating yeast, which, after fermentation, is continuously sepd. in a sedimentor from the partially fermented wort. The yeast is then sepd. into a fraction for recycle and a fraction for harvesting.

The homogenised recycle fraction is returned either to the fermentor or to the feed wort, and the fermentation stage contains ≯150% of the yeast needed to achieve fermentation in the required time. The residence time in the sedimentor is ≯0.5 that in the fermentor.

Alcohol content of the prod. is increased and deleterious bacteria are not introduced into the fresh wort. . . 19. 5. 79 as 876373 (19pp1251)

Adenine tri:phosphate determn. by bio-luminescence - using luciferin, luciferase and competitive inhibitor to give stable light intensity

LKB PRODUKTER AB 31.05.78-SW-006296

B02 J04 R16 (17.09.79) G01n

Determination of ATP comprises contacting the sample with D-luciferin, luciferase and Mg^{2+} ions (or certain other metal ions) so that the ATP and D-luciferin become bonded to the luciferase. The intensity of the light emitted by the reaction is a measure of the ATP concn. The improvement comprises adding a D-luciferin analogue (I) as competitive inhibitor for the reaction. (I) is pref. added in a concn. which reduces the light intensity by ⩾25 (esp. 50-90)%, and is pref. L-luciferin.

The presence of (I) gives a more stable level of luminous intensity, and hence higher sensitivity and reproducibility. The process can be used with ATP conversion reactions (i. e. where the ATP concn. varies), e. g. enzymic and NAD/NADH reactions important in clinical chemistry and microbiology, biochemistry and biology. The presence of (I) also gives saturation of luminous intensity at a lower D-luciferin concn., so that less (expensive) D-luciferin can be used. The stable intensity also allows easier measurement. Intracellular and extracellular ATP can be determined in the same sample, by determining the extracellular ATP, adding a lytic reagent and measuring the increase in light tensity. 30. 5. 79 as 876662 (25pp941)

Poly:glutaraldehyde, prepn. esp. as protein reactive microspheres - by dissolving glutaraldehyde in organic solvent and polymerising under alkaline conditions

CALIFORNIA INST OF TECHN 17.03.78-US-887825

A26 B04 J04 R16 (A96) (27.09.79) C07g-07 C08g-06 G01n-33 16

Prepn. of polyglutaraldehyde (PGA), PGA microspheres, magnetic metal- contg. PGA microspheres, fluorescent PGA derivs. and PGA-coated substrates is claimed.

PGA is prepd. by (a) dissolving glutaraldehyde (GA) in n aq. organic solvent medium contg. 5-80wt.% organic olvent; (b) increasing the pH of the soln. to > 7 (pref. -12); and (c) polymerising the GA, pref. by keeping the oln. at 15-30°C for 30-180 min. and then heating to > 40°C.

PGA contains conjugated aldehyde gps. $(-CH_2-CH_2-CH=C(CHO)-)$ which form stable bonds with NH_2-contg. cpds., e.g. proteins; it is easier to handle than GA and gives faster reaction rates. The PGA-based products can be used for electron-microscopic labelling, immunoassay, affinity chromatography, enzyme immobilisation, urea sepn., magnetic cell sepn., etc. 16.3.79 as 910414 (60pp)

NTE- ★ D16 72162B/40 ★EP ---4-431

Bacterial leaching of ores, esp. ferrous sulphide ores - including supplying oxygen in available combined form to bacteria

INTEROX CHEMICALS 23.03.78-GB-011541
M25 (03.10.79) C12d-13 C22b-03
D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

In the bacterial leaching of ores to extract metal values from them, the improvement comprises supplying oxygen in available combined form to the bacteria. The combined oxygen may be supplied in soln. form, e.g. an H_2O_2 soln; or it may be supplied in solid form, e.g. a per-compound or a peroxide addition cpd.

The process is esp. for treating sulphide ores, which frequently contain ferrous ions either as such or in combination with other metals forming more complex sulphides, using Thiobacillus (incl. Ferrobacillus) microorganisms, more specifically Th. ferro-oxidans and Th.thio-oxidans. These microorganisms can oxidise the sulphide and ferrous ions to sulphate and ferric ions, which, in aq. soln., can leach other minerals, such as ores of uranium (and other actinides), Cd, Co, Sn, Ti, Cu, Ni, Zn and Mo. Thus valuable metals are leached, probably as soluble sulphate species.

The bacteria are provided with oxygen much more readily than by the use of an air sparge. As a result they grow much faster and increase the yield of the leaching process.

12.3.79 as 300373.(19pp914).

Pure chondroitinase B prodn. - by chromatography using heparin-fixed agarose treated with chondroitin sulphate B as sepg. agent
SEIKAGAKU KK 10.02.78-JA-014550
B04 (D21) (23.08.79) C07g-07/02 C12d-13/10

Pure chondroitinase B is produced by subjecting partially purified condroitinase B liquor to column chromatography using a heparin-fixed agarose, treated with chondroitin sulphate B type, as sepg. agent. Pref. the partially purified is obtd. by treating extract, obtd. after break-down of chondroitinase B-producing fungal body, with protamine sulphate further fractionated by means of hydroxyapatite. Pref. the fungi body is of the fravobacterium genus cultured in a culture medium added with chondroitin sulphate or heparin.

Chondroitin sulphate B type is acidic mucopolysaccharid found with hepalitin sulphate on skin or vessels of animals and the substance promotes metabolism of cell by its water-holding property and blood coagulation inhibiting mechanism. Clarifying the structure of chondroitin sulphate B type is important for research of roll of chondroitin sulphate B type in living body and physiological mechanism. The elucidation of those items aids the development of chondroitin sulphate B type for medical application or cosmetic application. 10. 2. 78 as 014550 (7pp69)

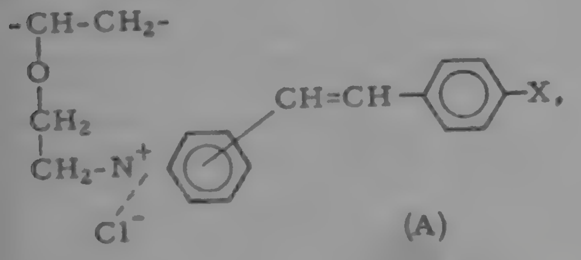
nsolubilising enzyme - by adding to aq. soln. of photocrosslinkable resin then irradiating soln. with light

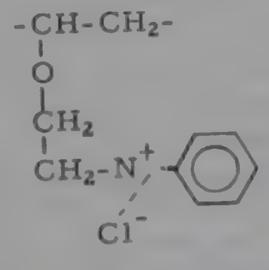
AGENCY OF IND SCI TECH 13.02.78-JA-015119

A97 B04 (23.08.79) C07g-07/02 C12d-13/10

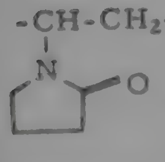
A photochemical method for insolubilising an enzyme (I) comprises (1) addn. of an enzyme to aq. soln. of resin (II), which consists of cross- linkable units of formulae, (A) and (B) or (C) and (2) irradiating with light to effect crosslinking.



(A)



(B)

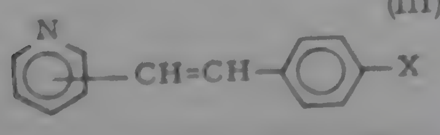


(C)

(X is H, lower alkyl or alkoxy).

When (I) fixed in gelled (II) is mixed in water, (I) separates from the gel. About 10 wt. % of (I) can be fixed in (II). The mole % of (A) in (II) should be 5-60%. (II) is produced, e.g. by (1) reaction between poly(2-chloroethyl vinyl ether) and stilbazole of formula (III), and reaction between the product and pyridine or (2) reaction between copolymer of 2-chloroethyl vinyl ether and N-vinyl pyrolidone and stilbazole.

(III)



The molecular wt. of (II)is pref. 5,000-200,000. The conc. of (II) in the soln. is 1-20 wt. % and the amt. of (I) added is 0.1-10 wt. % on the amt. of soln. 13. 2. 78 as 015119 (6pp42)

Antibacterial bacteriocin prodn. from Bacillus pyocyaneus - by culturing in presence of Mitomycin-C

MITSUBISHI CHEM IND KK 10.02.78-JA-014795

B04 (23.08.79) C12d-09/20

Prodn. of Bacteriocin comprises culturing Bacillus pyocyaneus in the presence of Mitomycin C and sepg. flexible rod-shaped bacteriocin from the culture liquor.

Bacteriocin, proteinic antibacterial substance having activity to other bacterial strains, the substance that is produced by a certain bacteria strain usually has high anti-bacterial action that may kill a bacteria using very small amts. e.g. a particle. Otherwise, Bacillus pyocyaneus has resistance to antibiotics and recently, infections in hospital and fatal results on lowering of resistance of host has caused problems. Bacteriocin produced by bacillus pyocyaneus is called piocin and several kinds of piocin exist.

As Bacillus pyocyaneus may be used any one having power producing flexible rod-shaped bacteriocin in the presence of Mitomycin derived from fungi body. For example, Bacillus pyocyaneus P-15-40 strain (origined from Bacillus pyocyaneus P 15 strain, FERM P-4387) and bacillus pyocyaneus M 12-E5 strain (origined from bacillus pyocyaneus M 12 strain, FERM P-438) etc. 10. 9. 78 as 014795 (4pp69)

*B04 (12.09.79) *J53094-020 C07g-11 C12d-09/04 +A61k-35/84*

Rigidoporus sp. is artificially cultured and the mycelia are extracted with an aq. solvent to provide a polysaccharide (I) having a molecular wt. $\geqslant$ 5, 000. (I) gives positive reactions to α-naphthol-sulphuric acid, phenol-sulphuric acid, indole-sulphuric acid, anthrone-sulphuric acid, tryptophane-sulphuric acid and, after hydrolysis, ninhydrin.

In an example, Rigidoporus sp. CM-306 (FERM-P 3035) is cultured in a medium consisting of peptone (3g.), yeast extract (5 g.), malt extract (10 g.), glucose (20 g.), potassium dihydrogen phosphate (0. 1 g.), dipotassium hydrogen phosphate (0. 1 g.), magnesium sulphate (0. 05 g.) and water (1 l.) at 25°C for 168 hrs. with shaking at 200 rpm. The mycelia are collected, washed with distilled water and dried. The dried mycelia (100 g.), are combined with 0. 4N NaOH soln. (2 l.) and the mixt. is stirred at 90-95°C for 2 hrs. Then, the mixt. is neutralised with 2N HCl to pH 7. 0 and subjected to centrifugation. 29. 1. 77 as 008240 C12d-9/04, A61k-35/84, C07g-11/00 (12. 9. 79) KUREHA CHEM IND KK (6pp)(J53094020)

Antitumour polysaccharide prodn from Inonotus fungi - by extracting cultured mycelia and removing low molecular components from the extract

KUREHA CHEM IND KK 29.01.77-JA-008244

*B04 (12.09.79) *J53109-913 A61k-35/84 C07g-11 C12d-09/04*

Prodn. of an antitumour polysaccharide from Inonotus fungi comprises extracting the mycelia of the fungi obtd. by artificial culture, and eliminating low molecular components of mol. wt. <5000 from the extract. The resulting polysaccharide gives positive colour reactions with α-naphthol-H_2SO_4, anthrone-H_2SO_4, tryptophan-H_2SO_4, Lowry-Folin reaction, and ninhydrin reaction after HCl-hydrolysis.

The polysaccharide exhibits potent antitumour activity on peritoneal or oral admin. to mice (Sarcoma 180). It also exhibits liver function improving action, antidiarrhoeal action and diuretic action. Also effective in recovery of immunity, prevention of adverse reactions caused by chemotherapy, and enchancement of susceptibility to irradiation. The mycelia can be produced by culture of a part of a plant to which the fungi adhere, or the fruiting body tissue or the spores on a liq. medium contg. the necessary nutrients.

In an example, a liq. medium (pH 6. 5) consisting of 3g peptone, 5g yeast extract, 10g malt extract, 20g glucose 0. 1g KH_2PO_4, 0. 1g K_2HPO_4, 0. 05g $MgSO_4$ and 1 l water was used to culture the mycelia of Inonotus cuticularies. 29. 1. 71 as 008244 C12d-9/04, A61k-35/84, C07g-11/00 (12. 9. 79) KUREHA CHEM IND KK (6pp) (J53109913)

Microbial culture growth unit - has parallelepiped tank with central and two peripheral chambers contg. transverse heat-exchange plates
YUZHGIPROBIOSINTEZ 27.12.76-SU-435533
(22.02.79) C12b-01/10

The microorganisms culture growing is accelerated using unit comprising the parallelepiped shape tank divided into three chambers by longitudinal partitions. The covered central chamber is fitted with an aerator and culture medium disperser, while the peripheral chambers are sepd. into transverse sections by heat exchanging plates.

The aerators and fluid dispersers are set in the sections, and a collector of biomass concentration is mounted above the central chamber with connection to the latter. The nutrient is fed to the central chamber and overflows to the sections of the peripheral chambers. The culture fluid jets out by ejectors into the top of peripheral chambers where the aerial suspension changes its direction due to foam breakers and deflectors.

Determining resistance of maize to stalk moth - by observing inhibiting effect of antibiotic extracted from maize leaves on growth of Staphylococcus aureus culture
MAIZE RES INST 15.08.77-SU-516361
C03 P13 (18.01.79) A01h-01/04

Resistance of maize against stalk moth is determined by preparing an alcoholic extract of comminuted maize leaves and placing 4 drops of the extract into a small recession (dia. 14 min.) in a meat-peptone agar preparation inoculated with Staphylococcus aureus 209.

The antibiotic contained in the maize extract inhibits the growth of the Staphylococcus aureus around the recession. The strength of this action is determined by measuring the diameter of the sterilised area. This antibiotic acts also against the stalk moth. This method is much simpler and more accurate than the methods used for this purpose heretofore.

The peroxidase compsns. are stable and useful in enzyme immunoassay tests, esp. for haptens. The metal ions confer the increased stability. 9. 9. 77 as 831817 (3pp997)

CORP ★ D16 73481B/40 ★US 4169-013
Glucoamylase prepn. - by culture of suitable organisms on media contg. ground corn liquefied by heat and alpha-amylase
CPC INTERNATIONAL INC 28.07.76-US-709148 (05.12.74-US-529879)
(D17) (25.09.79) C12n-09/34

The known prepn. of glucoamylase (I) by the culture of a (I)-producing organism on a pre-sterilised nutrient medium with aeration, and (as a final development stage) the inoculation of the seed stage of the (I)-producing organism onto a pre-sterilised fermentation medium contg. a carbohydrate C source (enzymatically liquefied ground corn) and an N source and the subsequent culture of this fermentation medium is improved by using a sterile fermentation medium.

This medium is prepd. as follows (a) a medium is prepd. by mixing ground corn (prim. C source), a prim. N source and H_2O at 20-60; (b) the medium is heated with steam to 55-80°/pH 4.5-7.5 in the presence of a bacterial α-amylase prepn. (from a Bacillus licheniformis; added before or during heating) until all the ground corn is liquefied; (c) the medium is terilised with steam at $\nless$ 100°C; (d) the medium is then cooled and is suitable for inoculation with the seed stage of the (I)-producing organism. In step (d), the liquefied corn has solids content 16-25% by wt. (dry basis).

The economical process may be carried out in aq. media at relatively high concns., and allows the use of increased levels of liquefied ground corn without the known corresp. increase in viscosity. The time needed to reach sterilisation temp. is also decreased. 28. 7. 76 as 709148 (7pp478)

Separator for clarifying suspensions esp. molasses - has drum with chamber and diffusors to distribute incoming suspension
PLAVA SMYCHKA MECH 28.04.77-SU-481525
J01 P41 (17.01.79) B04b-01/06 B04b-11

The separator for clarifying suspensions particularly molasses, comprises a drum with cylindrical inserts fixed in holders. The inserts have outlet apertures. There is also a supply inlet. In order to raise productivity and to make clarification more efficient, the drum has a mechanism to distribute the incoming suspension, fixed on the upper holder. This consists of a chamber under the supply inlet, and diffusors, connected to the chamber cavity. The distance from the axis of rotation of the drum to the outlet ends of the diffusors exceeds that from the axis of rotation to the outlet apertures of the first cylindrical insert.

The initial suspension enters the receiving chamber and spreads on the conical surface, creating excess hydrostatic pressure. It then enters the diffusors, in which laminar outflow conditions are created by their immersion in the suspension and smooth entry of the suspension.

Leather liquid treatment drum sampler - has inner funnel with truncated cone-shaped perforated casing
UKR LEATHER FOOTWEA 10.03.77-SU-461263
(08.01.79) C14c-15

The handling of samples taken for the drum of liquid treatment of leather is improved using a funnel fitted inside the drum. The casing is in the form of a truncated cone which is attached by its wide base to the inside of the bottom between the inclined shelves. During the rotation of the drum, the gravity flowing fluid from shelves breaks up into droplets passing through the perforations of the casing.

The raining droplets reach the funnel for discharge through the pipe, while pieces of leather and other solid impurities dropping from the shelves do not reach the casing. They are diverted into the working zone of the drum by the inclined surface of the casing without jamming the perforations.

Copolymers of ethylene oxide and/or propylene oxide - with long chain alkylene oxide(s), used as emollients in cosmetic emulsions, creams etc.
AKZO NV 18 05 78-DT-821654
A96 (A25) (17.09.79) A61k

Copolymers of ethylene oxide (I) and/or propylene oxide (II) with long chain alkylene oxides (III) having a minimum chain length of 6 C, are used as emollients in emulsions, creams, pastes and cosmetic pencils. The copolymers are pref. sequenced, with the (III) in blocks with a mol. wt. of 1.10^3-1.10^4, esp. 2.10^3-6.10^3. The wt. ratio (I) and/or (II) to (III) is pref. 5:95-70-30, esp. 25-75-40:60.

The copolymers are used e.g. in water-in-oil type emulsions contg. (by wt.) 1-10% of the copolymer, 20-75% water, 1-10% emulsifiers and fatty acid esters and/or vegetable fats and/or animal fats and/or waxes and/or fatty alcohols and/or hydrocarbons of the type normally used in cosmetic emulsions. The copolymers can also be used in water-free cosmetic creams, pastes, etc. The copolymers render the skin soft and more ready to absorb the active constituents of the compsn., and improve the adhesion of decorative cosmetics to the skin. They give stable emulsions and are odourless, so that they are useful substitutes for lanolin in cosmetic preparations. 16.5.79 as 876276 (14pp513)

COLG ★ D21 71735B/40 ★BE -876-314
Transparent gel dentifrice of specified compsn. - contg. pure lauryl sulphate, not clouding on ageing
COLGATE PALMOLIVE CO 19.05.78-GB-020758
A96 E19 (A25) (17.09.79) A61k

Compsn. comprises a dentifrice vehicle contg. 5-50% of a polishing agent having an empirical SiO_2 content of at least 70%, a granulometry of 1-35μ., a structure substantially amorphous to X-rays and a refractive index of 1.44-1.47; a liquid phase, having a refractive index compatible with the polishing agent to enable transparency, contg. a humectant; a solid phase contg. a gelling and/or thickening agent, a cpd. providing 0.01-1% F chosen from alkali metal fluorides and monofluorophosphates, and 0.1-5% of a surfactant mixture comprising a narrow cut alkali metal lauryl sulphate and another anionic surfactant (I).

(I) is (a) alkali metal salt of higher satd. aliphatic N-acyl deriv. (amide) of lower aliphatic aminocarboxylic acid; (b) alkali metal salt of sulphate of an alkylene oxide condensate with a higher satd. aliphatic fatty alcohol; and/or (c) phosphate comprising a mixt. of mono- and di-esters of formula $R(OC_2H_4)n\text{-}O\text{-}P(O)(OM)_2$ and $R(OC_2H_4)n\text{-}O\text{-}P(O)\text{-}(OM)O\text{-}(C_2H_4O)R$ in which R is 10-20C alkyl, n is 1-6, M is H, alkali metal or ammonium; the ratio of alkali metal laurylsulphate to the other surfactant is ≥ 2:1. By 'narrow cut' above, is meant contg. ≥90% of 12 C alkyl radicals.

The transparent gel formulation avoids cloudiness encountered in prods. contg. Na lauryl sulphate and alkali metal fluoride cpds. 17.5.79 as 876314 (13pp597)

COLG ★ D21 71736B/40 ★BE -876-315
Dentifrice of specified compsn. contg. fluoride and colourant - with acid additive to avoid colour loss on storage
COLGATE PALMOLIVE CO 19.05.78-GB-020759
E37 (E24) (17.09.79) A61k

The compsn. comprises a dentifrice vehicle contg. 5-50% of a siliceous polishing agent having an empirical SiO_2 content ≥70%, a granulometry of 1-35 μ, a structure substantially amorphous to X-rays and a refractive index of 1.44-1.47; a cpd. providing 0.01-1% F chosen from alkali metal fluorides and monofluorophosphates; 0.0007-0.05% of a red or yellow monazo colourant or a blue triarylmethane colourant which is non-toxic and water-soluble; and 0.05-0.5% of an additive which is benzoic acid and/or phytic acid for alkali metal monofluorophosphates and benzoic acid for alkali metal fluorides.

The additive reduces the loss of colour occurring whe the compsn. contains a siliceous agent and fluoride or m nofluorophosphate. 17.5.79 as 876315 (16pp597)

OSAKA TRANSFORMER KK 14.02.78-JA-016081

M22 P53 (27.08.79) B22d-27/17

The lower electrode with an aperture and a non-consumable electrode are in an air tight chamber, the aperture coinciding with an aperture of the chamber. A mould is attached to the air tight chamber, with the aperture of the air-tight chamber coinciding with the gate of the mould so that a passage may be formed for molten metal.

A shielding member is placed between the air-tight chamber and the mould. Inert gas, e.g. argon, is introduced into the chamber and the mould after the air is sucked out.

Metals such as Co-Cr alloys or Ni-Cr alloys can be relatively easily melted. 14. 2. 78 as 016081 (5pp87)

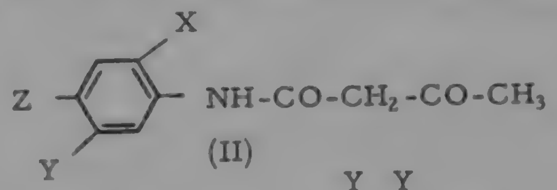
Dyeing keratinous materials e.g. human hair - with development dyes of a diazonium salt and an acetic acid arylamide as coupling agent

HENKEL KG AUF AKTIEN (CIBA) 25.02.77-CH-002394

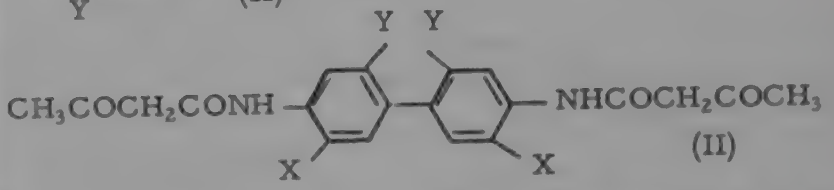
*E24 (25.09.79) *DT2807-780 A61k-07/13*

Human hair is dyed with developing dyes by applying effective amts. of diazo salts and coupling agents for dyeing in any sequence, and at 15-40°C, coupling the 2 components together.

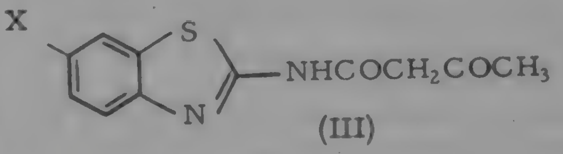
The coupling component is an acetoacetic acid acrylamide of formula (I), (II) or (III) where X, Y and Z are each H, 1-4C alkyl or alkoxy, or a halogen. Pref. the coupling agent is (I), where X and Y are each methoxy and Z is Cl; (II) where Y is H, and X is Me; or (III),



(II)



(II)



(III)

where X is ethoxy.

The components used overcome the disadvantages of using oxidation dyes, such as p-phenylenediamine and benzidine. The prod. covers the colour range from yellow to brown by variation of the diazo component. 24. 2. 78 as 880925 (5pp931)

Prefilling sterilisation of milk containers with bactericidal aerosol - produced by ultrasonic atomisation of liq. for entrainment in air current

EX-CELL-O CORP 16.05.78-US-906159
P34 (D13) (17.09.79) A61l

Sterilisation of a container with a bactericidal aerosol is claimed. A predetermined vol. of a bactericidal liq. is contained in a nebulising chamber. The chamber is fitted with a piezoelectric crystal oscillator which produces ultrasonic vibrations atomising the surface of the liq. to fine particles. Compressed air is piped into the chamber to pass over the liq. surface, entrain the particles and form an aerosol. The aerosol is piped to a nozzle which is directed into the container to be sterilised.

The chamber outlet for aerosol is pref. located centrally just above the surface level of liq. The chamber inlet for compressed air is above the aerosol outlet level. The liq. level in the chamber is pref. maintained automatically by controlled make-up from a reservoir. The chamber is pref. provided with a liq. overflow outlet and a low-level cutout.

Used for fitting to a filling machine to sterilise containers to be filled with homogenised milk, skimmed milk, butter egg-based drinks, etc. Optimum mixt. of liq. in carrier gas is obtd. Continuous control of aerosol concn. is achieved. Very fine atomisation of liq. is obtd. with no danger of droplet agglomeration in the nozzle. 16.5.79 as 876292 (27pp148)

A water-breakable seal in the end closure of a tubular heat-sealable fluid permeable overwrap of an absorbent tempon is formed by gathering and pleating the overwrap end, compressing at an isolated region of smaller size than the closure, and heating the region by conduction to fuse it into a rivet-like agglomerate from one surface to the other of the closure.

The material is held under compression while cooling. The overwrap is pref. of fabric weighing 0.4 oz/yd^2, the pressure on the region is at least 22,000 lb/in^2, and the material is heated to at least 200°F. The apparatus is claimed. 5. 8. 77 as 822296 (8pp1358)

A tampon or similar hygienic article having high fluid suction and holding power for aq. physiological fluids is produced, in which a viscose spinning solution is prepd. from cellulose xantogenate by dissolving it in aq. caustic soda.

The spinning soln. is then aged, spun in an acid spinning bath, and the resultant fibres cleaned and dried. 5-20 wt. % of sodium carboxymethyl cellulose (wrt cellulose in the soln.), is added to the soln. The partly reticulated fibres obtd. are cleaned in an acid soln., the fibres formalised, the sodium salt regenerated and the fibres washed until neutral.

The absorbent material prepd. in the process is esp. used for tampons, sanitary napkins, baby diapers and hospital pads. 9. 9. 77 as 831755 (2pp931)

MOOR- ★ D22 73536B/40 ★US 4169-123

Cold gas sterilisation using hydrogen peroxide - for plastic contact lenses, plastic foam medical swabs, etc.

MOORE-PERK CORP 26.09.77-US-836667 (11.12.75-US-639966)

E36 P34 (25.09.79) A61k-33/40 A61l-13

Method of 'cold' gas sterilisation consists of surrounding the article to be sterilised with H_2O_2 (I) gas. (I) gas is kept in contact with the article at <80°C until it is sterile, and the article is then kept free from recontamination until it is to be used.

(I) has good penetrating props., and although decompen does occur, sufficient gas penetrates into the pores of articles, and through gas permeable wrappers, etc. to kill even the most resistant forms of microbial life. Method avoids direct contact with liq. (I) and is suitable for sterilising plastic contact lenses or plastic foam medical swabs etc. 26. 9. 77 as 836667 (5pp478)

MOOR- ★ D22 73537B/40 ★US 4169-124

Low temp. sterilisation - using hydrogen peroxide at reduced pressure

MOORE-PERK CORP 26.09.77-US-836665

E36 P34 (25.09.79) A61k-33/40 A61l-13

Cold gas sterilisation is carried out by contacting an article to be sterilised with gaseous hydrogen peroxide at a concn. <75 mg/l., and at a temp. <80°C, until sterilisation is complete.

The process is esp. useful for sterilising contact lenses. The process is simple, rapid, and cheaper than hylene oxide sterilisation. It does not require long riods of storage to eliminate residual sterilising agent om treated items. 26.9.77 as 835665 (5pp955)

Press for moulding cakes of soap and similar materials - has cavity overflow passages to anchor concave prod. from falling out

MECCANICHE MODERN 11.05.79-IT-022611 (31.05.78-IT-024063)

(17.09.79) B29c C11d

The machine is of the type having a vertical platen with several sets of half mould cavities on ≥1 face. The sets are symmetrically arranged around a horizontal axis of rotation of the platen. Intermittent rotation brings each set of cavities in turn to successive processing stations, namely paste blank loading station, compressing moulding station, and demoulding station.

Each cavity now communicates with an adjacent overflow passage formed in the platen. Excess paste is forced into these passages during the loading and moulding station operations. The material in the passage anchors the prod. to the cavity until demoulding takes place. Each overflow passage pref. extends right through the platen and is divergent to max. cross-section on the far side from the cavity.

Cavities can be provided on both sides of the platen which is then located between thin sets of loading, moulding and demoulding stations.

When moulding cakes of soap with convex surfaces there was previously a problem in retaining the prod. in the platen cavity as the platen rotated sets of favities between stations. The prods. is now anchored to the platen by excess material forced into the overflow passage. 31.5.79 as 876704 (+21.2.79-IT-020403) (15pp448)

Sepg. linear from branched chain soaps using a lithium cpd. - esp. for acids prepd. via hydroformylation of olefins

UGINE KUHLMANN 13.01.76-FR-000680

*E12 (E17) (22.02.79) *BE-850-091 C07c-51/42 C07c-53/24*

A process for the sepn. of straight chain soaps from branched chain soaps and their acids comprises adding to an aq. soln. of the soap mixt. a sol. lithium cpd.

The process is esp. applied to the mixt. acids obtd. by hydroformulation of linear olefins followed by oxidation of the aldehydes. The straight chain soaps have properties similar to natural soaps. The branched chain soaps have a superior wetting lower by inferior foaming power to natural soaps. The lithium salts of the soaps of straight chain acids have the advantage of being easily isolatable by filtration or centrifugation whereas previous attempts at sepn. using other alkali metal soaps have been unsatisfactory. The process enables sepn. of the acids in high purity. Person, L. Bul. 46/15.12.78. 12.1.77. as 439052 (5pp)

Cleaning powder pack - in which pack surface is impregnated with perfume

UNILEVER LIMITED 23.03.78-GB-011727

Q34 (03.10.79) B65d-65/42 C11d-03/50

D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

A pack contg. cleaning powder, (at least a part of) the surface of which has been impregnated with a perfume, is new.

Pref. the pack is a carton or drum formed from a blank which has been sprayed with a soln. of perfume in the region corresponding to the headspace in the finished pack.

The pack is esp. for storing cleaning powders (esp. fabric washing powders) which contain components (e.g. bleach) which adversely affect the stability of perfumes incorporated in the powder. However it can also be used with other powder formulations to increase the perfume impact of such formulations.

Incorporation of cation-active antistatic agent (4) facilitates removal of fine particles by brushing or suction of the textile. 17. 3. 75 as 031247 (+18. 3. 74-US-452339) C1ld- 7/60 (7. 9. 79) DU PONT DE NEMOURS CO (5pp) (J50127905)

PROC D25 68716X/37 =J7 9027-004

An additive for detergents and their compsns. - contg. a vitreous phosphate of specified formula

PROCTER & GAMBLE CO 16.06.75-US-587451 (20.02.75-US-551476)

*A97 E37 (07.09.79) *BE-838-751 C11d-03/06*

A detergent compsn. comprises - (A) 0.1-4% of a vitreous phosphate of formula $(M_2O)_x(P_2O_5)_y$ where M is an alkali metal, y is 5-50 and y:x is from 1:1 to 1:1.5 (B) 5-35% of a mixture of salts based on pyrophosphates and orthophosphates in ratio 1:1 to 200:1, (c) 0-30% of a tripolyphosphate salt (d) 3-30% of an anionic, nonionic, dipolar character or ampholyte surfactant, with the total phosphate in the composition being from 5-35%. Also an additive for detergents comprises 1-90% of (A) above and 10-99% of an organic protecting agent of m. p. 38-95°C. Also, a granular detergent contains 1-15 pts. of the above additive and 85-99 pts. of granular detergent comprising 2-35% surfactant and 10-65% salt additive.

Used in washing powders, the vitreous phosphate has a marked effect, particularly in hard water, of maintaining whiteness by preventing redeposition of soiling matter. Also the quantity of phosphate is less than that required for total sequestering of mineral in hard water and the tendency of the phosphates to form precipitates on washing machine surfaces is reduced. 15. 10. 75 as 123352 (+20. 2. 75, 16. 6. 75-US-551476, 587451) C1ld-3/06 (7. 9. 79) PROCTER & GAMBLE CO (14pp)(J51109003)

PATENT NUMBER INDEX (VII)

Weekly by section and overall. Lists left to right the patent type (* for basic, = for equivalent or ≠ sign for non-convention equivalent or where the priority has been artificially "added" to the specification), patent number, accession number and CPI classes.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100

Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

RAB- D11 52196V/29 =DS 2300-039
ough kneading machine - having two contrarotating elements of ctangular section terminated by triangles
BRABENDER OHG 02.01.73-DT-300039
*(04.10.79) *DT2300-039 A21c-01/08*

dough kneading element for dough testing consists of wo contrarotating mixing paddles. Each paddle has a ectangular central section, with a triangular section at ach end, flattened slightly at the top. Each of these ections is twisted over its length, with an acute angle the longitudinal axis. One of the triangular sections has t one end a cut-out, shaped like a quadrant, and the other as a similar cut-out at the opposite end.

This simulates the action of high-speed kneading achines so that their action on dough can be predicted, nd the required kneading time can be determined. . 1. 73 as 300039 (7pp39)

ABW ★ D11 73701B/41 ★DT 2812-122
rying of wheat gluten - by passing through cutter mixer with dried articles into flash dryer
BABCOCK-BSH AG 20.03.78-DT-812122 (00.00.77-DT-736549)
Q76 (04.10.79) A21d-02/38 F26b-03/12

he Parent Patent described the thermal treatment of stic- y materilas, esp of wheat gluten in a flash dryer by hot ir in concurrent or counterflow. The material to be treat ed is mixed outside the dryer with already dried particles n a ratio of 1:2-1:5 and reduced in size at the same time. he final drying then takes place in the flash dryer.

The addition patent achieves a substantial redn in power onsumption and a shorter drying time which helps to preserve the vitality of the gluten. 20. 3. 78 as 812122 Add to 2736549(6pp39).

SCHE/ ★ D11 73882B/41 ★FR 2413-035
Semiconductor control device for bakery ovens - avoiding hum and including vapour generator to improve quality of bread
SCHEYEN M 30.12.77-FR-039975
R59 (31.08.79) A21b-01/40 A21b-03/04 H05b-01/02

Electric bakery ovens are provided with a control device comprising contactors, conventional relays and semi-con -ductors for feeding the heaters and a programmer; a vap -our generator is included for improving the quality of the loaf. The control device renders it possible to feed one or other of the groups of heating resistances and thermostats can cut the feed to the compartments of the oven when the programmed temp. is attained.

The vapour generator consists of a container fed with water through the valve, one or more heating resistances, a regulating thermostat and electric valves controlling the supply of superheated water to the flash expansion boxes arranged in the different compartments of the oven. A safety valve is fitted to the container. The expansion boxes may also be fitted outside the cooking compartments of the oven, suitably placed inlets being arranged to secure good distribution of the vapour.

The control device economies in energy and avoids any hum. The water vapour preserves the flexibility of the crust and gives the latter a colouration and brilliant appearance whilst limiting the loss of water by undue drying of the bread during cooking. 30. 12. 77 as 039975 (7pp519)

GOAL/ ★ D11 73883B/41 ★FR 2413-036
Machine for automatic mfr. of pancakes etc. - by deposition of controlled shape, and thickness of paste onto cooking surface
GOALABRE R 02.01.78-FR-000097
(31.08.79) A21c-11

The machine is of the type which spreads an area of paste on to a cooking surface. The spreading device now comprises a paste reservoir in the form of a tank of which one side is a cylindrical drum rotating on a horizontal axis. A moving doctor blade in contact with the drum surface determines the width and shape of the paste area which is transferred by the drum from the tank to the cooking surface. Transfer is effected by relative movement between the spreading device and the cooking surface.

The doctor blade is pref. oscillated or reciprocated tangentially to the drum. The front edge of the blade is pref. concave so that oscillation releases a paste area of width which first increases to a max. and then progressively decreases again, e. g. a circular area. The doctor blade can pref. be locked in a fixed position so that paste can be deposited as a continuous band of selected width.

Used for mfr. of pancakes, girdle cakes, etc. The machine can deposit cleanly onto flat cooking surfaces or onto cylindrical cooking surfaces which may be below, above or alongside the transfer drum. The paste reservoir can be positioned well away from the cooking surface so that the paste does not become preheated. Width and thickness adjustments are easily made. 2. 1. 78 as 000097 (17pp448)

DCAF D11 26833Y/15 =GB 1553-925
Extruding dough products, esp. doughnuts, with liquid filling - using sleeved dough nozzle with valved concentric filling nozzle
DCA FOODS INDS INC 16.03.76-US-667379
*(10.10.79) *US4015-518 A21c-09/06 A21c-11/16*

Formation of two component food products is described using an extrusion nozzle and cutter to form sections of the plastic material while a filling mechanism within the nozzle body. The filling mechanism is selectively operated according to the operation of the outer shell forming mechanism to ensure the correct positioning of the filling within the shell.

The arrangement is esp. suitable for forming shaped pastries filled with jam or jelly. 29.12.76 as 054189(8pp)

SHIR- ★ D11 74593B/41 ★J7 9019-450
Binding mixt. for preparing buckwheat noodles - comprises glucose of starch powder and albumen
SHIRATORI SEIFUN KK 30.06.76-JA-077324
(16.07.79) A23l-01/16

Mixt. consists of 15-35 pts. of glucose of starch powder and 85-65 pts. of albumen powder. The mixt. is used for prepn. of buckwheat noddles as binder without damage to taste and flavour of buckwheat powder. 30. 6. 76 as 077324, A23l-1/16, (16. 7. 79) SHIRATORI SEIFUN KK (4pp42)(J53024046)

DIER ★ D11 74667B/41 ★NL -161-339
Dough kneading appts. comprising rotating tub - contg. two rotating kneading tools arranged to give minimum heat generation and vibration-free operation
DIERKS & SOHNE 30.04.68-DT-757361
(17.09.79) A21c-01/02

Dough is kneaded in a rotating tub with vertical cylindrical walls and a flat floor in which two kneading tools with vertical parallel axes are placed. Each tool comprises a screw-form longitudinal section and a horizontal floor leg, and the tools are so placed that the outer one almost scrapes the wall of the tub and rotates in such a manner that its direction of motion at the tub wall is opposed to that of the tub and that the furthermost inner point of the inner tool coincides with the axis of the tub.

The horizontal legs of the two tools are at right angles to each other and they rotate in the opposite sense. The design is such that no dough passes between the outer tool and the wall of the tub with the result that there is minimal generation of heat and the process is vibration free. 23.4.69 as 006246 (6pp1370).

BAKP D11 39853S/23 #NL-161-340
Biscuits prodn
BAKER PERKINS LTD 30.11.70-BE-759635 24.11.70 NL 017147
*(17.09.79) *BE-759-635 +A21c-03 A21c-09*

A continuous laminated strip of dough as is required for crackers with an additive enclosed between layers is mfd. by feeding a strip of dough continuously onto a conveyor moving at right angles to the dough feed direction. The feed device moves from side to side across the conveyor so that the dough layer is continuously lapped back onto itself. A second feed device for the additive also moves from side to side across the conveyor, its movement being synchronised with that of the dough feeder.

The additive supply is interruptible so that, on one traverse, a layer of dough followed by a layer of additive is laid, and, on the reverse traverse, the additive layer is covered by a second layer of dough. This is pref. achieved by means of two belt conveyors, one to receive the dough and the other to feed the additive. The additive conveyor is equipped with a constant speed drive and a constant feed device for placing the additive onto the conveyor. In addn., the belt has a means of extending its outer end to traverse the receiving conveyor.

The rate of extension is equal to the rate at which dough is deposited and also equal to the speed of the additive belt. This is an extremely simple and economic process c.f. prior art. 24.11.70 as 017147 (7pp1370).

D12 : MEAT; FISH PROCESSING

PROV= D12 04701A/03 =DS 2729-094
Solid particles condensed from fish roe soln. or suspension - with thorough cooling and forced circulation of cooling liquid
PROVISIONS EQUIP (HETO) 28.06.76-SU-378188
*(04.10.79) *DT2729-094 A23p-01*

Artificial cavier is produced from a soln. of albuminous substances which are metered by a perforated disc, rotating over a perforated plate, and extruded into a heat exchanger. The top end of the exchanger tube are coaxial with the plate perforations to which they are joined by protruding nozzles of an intermediate heat insulating plate. They leave a narrow annular gap and the soln. dropped through the nozzles solidifies to roe-like grains.

This produces artificial roes of adequate quality. It consumes little working fluid and has a high throughput. 28.6.77 as 729094 (8pp39)

DALM- D12 19714A/11 =DS 2749-293
Machine to extract edible muscles from crustacea - esp. antarctic krill fresh or frozen on ship or shore
DALMOR PRZED POLOWOW DAL 03.11.76-PO-193450
*(04.10.79) *BE-860-439 A22c-29/02*

A machine to separate the edible muscle from the abdomen of antarctic Krill, leaving the inedible albumin layer on the chitin carapace, includes a high-inertia high-speed impeller woth a working disc on a vertical shaft. A feed bush, centrally mounted, has a serrated ring close to the working disc. Vertical pins leave between the active surface of the working disc and their pointed ends a narrow gap, the pointed ends are inclined at 10-30° to the vertical. Angular pins termine 20 mm below the rim of the working disc.

This machine has a low power consumption and produces a good yield of Krill food for direct use of for preserves. 3.11.77 as 749293 (8pp39)

FARH ★ D12 73767B/41 ★DT 2813-847
Tubular package sheath - with plastic coating for inside or outside location after filling with contents esp. sausage meat
HOECHST AG 31.03.78-DT-813847
A92 Q31 (04.10.79) A22c-11/02 B65b-03

Hoses with an outer coating of a plastic can be filled, e.g. with sausage meat, in the usual way by pulling them in corrugated shape over the filler tube of a sausage medium. If the coating is to lie inside, in contact with the filling, a short end piece is freed from corrugations, closed and pushed, closure first, into the open end of the filler tube. The corrugated rest is then pushed over the filler tube.

This system is partic suitable for the alternative utilisation of sausage skins, made of hydrated cellulose, with or without fibre reinforcement, and with an outer coating of vinylidene chloride copolymer. 31.3.78 as 813847(19pp)

DAIK ★ D12 73983B/41 ★GB 2017-887
Appts. for chilling poultry carcasses - with repeated spraying of carcasses with water during chilling
DAIKIN KOGYO CO LTD (DAIK- IJIC-) 30.03.78-JA-037823
(10.10.79) A23b-04/06

Chilling appts. for broiler carcasses includes a chilling room having an inlet and outlet. A conveyor continuously carries the carcasses along a path from the inlet to the outlet. An air chilling unit supplies cold air to the room and a water spray device supplies water to the surface of the carcasses.

Carcasses are loaded onto the conveyor just upstream of the inlet, and unloaded just downstream of the outlet. The conveyor comprises a continuous rail with shackles mounted for movement along it. In use the carcasses are sprayed with the water several times and the chilled air is passed over the moistened carcasses.

Appts. is partic. for chilling eviscerated poultry carcasses. Cross-pollution and shrinkage and discoloration of the carcass surface is minimised. 8.9.78 as 036181 (15pp295)

NICA ★ D12 74119B/41 ★J5 4110-352
Artificial roe prodn. - by preparing liq. droplets of roe material, dropping into stream of coagulating liq., sepg. from stream, dropping in film-forming liq., etc.
NIPPON CARBIDE KOGY KK 20.02.78-JA-018363
(29.08.79) A23l-01/32

Process comprises (a) preparing liq. drops of roe substance with a special nozzle so that the core substance is covered with the base substance; (b) dropping the liq. drops into a stream of coagulating liq.; (c) sepg. them from the stream; (d) washing with water; (e) dropping into a stream of film-forming liq.; (f) sepg. and washing with water; and (g) gelling to a prescribed hardness.

Pref. the special nozzle has such a structure that the horizontally projected plane of the head cross-section of the nozzle for the core substance is included (partly) in the horizontally projected plane of the head cross-section of the nozzle for the base substance. The nozzle is pref. installed such that the distance between the head of the nozzle and the surface of the coagulating liq. is 5 - u/2.5 mm favourably 10-70 mm (u is viscosity of the base substance at the dropping temp. in cps.).

Artificial roes similar to those of salmon, trout, etc. which are excellent in taste and flavour, form and texture can be prepared easily. 20.2.78 as 018363 [illegible].

DAIW ★ D12 74120B/41 ★J5 4113-3
Prodn. of protective casings for ham, sausages, etc. - using cellulose and polyolefin fibre sheet impregnated with viscose
DAIWA SPINNING KK 15.02.78-JA-016737
A97 Q31 (29.08.79) A22c-13 B65b-09/16

The method comprises (a) mfg. a fibrous sheet from 25 - 60 w/w% of the fibre-form or the pulp-form fibrous material of polyolefin resin and balance wt.% of cellulose ibre, (b) heating the fibrous sheet at a temp. above the softening point of the polyolefin resin, thus softening or melting the polyolefin resin fibre and bonding the fibres n the fibrous sheet each other, (c) impregnating viscose nto the fibrous sheet and (d) reclaiming cellulose by treating the viscose with sulphuric acid.

The fibrous sheet has excellent strength partic. under wet and/or alkaline condition and does not undergo breakage when impregnating the viscose. Thus it can be prepd. inexpensively by a simple process with high productivity. It is used to form protective casings for ham, sausages, etc..

As cellulose fibre Manila hemp, etc. is pref. used and it is pref. to use rayon fibre 10-30 w/w% on the fibrous sheet together with Manila hemp for attaining the porous bulky fibrous sheet. It is also desirable to treat the fibrous sheet with nonionic surfactant such as sucrose fatty acid ester, polyoxyethylene-phenolether, etc. for improving the impregnation of viscose. 15.2.78 as 016737 (4pp5).

DAIW ★ D12 74121B/41 ★J5 4110-357

Prepn. of protective casings for meat - by treating cellulose sheet with thermoset resin and reactive acrylate resin, heating, covering with viscose and regenerating cellulose

DAIWA SPINNING KK 15.02.78-JA-016738

A97 Q31 (29.08.79) A22c-13 B65b-09/16

The method comprises (1) treating fibrous sheet of cellulose fibre with (a) cationic thermosetting resin composed of reaction prod. of polyamide having sec. amine group and epichlorohydrin and (b) reactive acrylate resin, (2) heating the treated fibrous sheet to harden the resin mixture, (3) covering with viscose and (4) regenerating cellulose by treating viscose with H_2SO_4. Fibrous sheet which shows excellent strength partic. under wet condition and/or alkaline condition, can be obtd.. (I) can be used favourably as material for protective casings of ham, sausage, etc..

Specifically the cationic thermosetting resin(a) and the reactive acrylate resin(b) are used with the solid proportion 1:3-10. Pref. the fibrous sheet is treated with nonionic surfactant such as sucrose fatty acid ester, polyoxyalkylphenolether, etc. for improving the impregnation of viscose. 15.2.78 as 016738 (4pp).

TOXN ★ D12 74591B/41 ★J7 9011-374

Colouring meat e.g. beef and pork - by impregnating with mixt. of pink pigment obtd. from Monascus purpureus and e.g. (deoxy)adenosine, (deoxy)cytidine or thymidine

TOYO JOZO KK 07.06.74-JA-065228

E19 (D16) (15.05.79) A23l-01/27

Pink pigment produced from 'Monascus purpureus' of microorganism is mixed with adenosine, deoxy-adenosine, guanosine, deoxy-guanisone, cytidine, deoxy-cytidine, thymidine, adenosine-monophosphoric acid, denosine-diphosphoric acid, adenosine-triphosphoric acid, guanosine-monophosphoric acid, cytidine-monophosphoric acid, cytidine-triphosphoric acid, thymidine-monophosphoric acid, cytosine-deoxy-riboside-diphosphate ester, ribonucleic, deoxy-ribonucleic acid or their salt(s) and the resulting mixt. is impregnated in various kinds of meats.

The colourising process is suitable for ham, sausage, tuna, salmon, swine meat or beef. 7. 6. 74 as 065228 A231-1/275 (15. 5. 79) TOYO BREWING KK (4pp15)(J5 0155658)

Thawing frozen meat in absence of oxygen - by placing frozen meat and oxygen-absorbing agent in sealed container and thawing

MITSUBISHI CORP 17.02.75-JA-020180

(17.09.79) A23b-04/06

Method comprises placing frozen meat and an oxygen-absorbing agent (I) in a sealed container and thawing the frozen meat in the absence of oxygen. (I) is e.g. pyrogallic acid, oxalic acid, sodium sulphite, or sodium dithionite. When dithionite is used, an SO_2 absorbing agent such as alkali hydroxide is also placed in the container. 17.2.75 as 020180, A23b-4/06 (17.9.79) MITSUBISHI CORP. (4pp83) (J5 1106759)

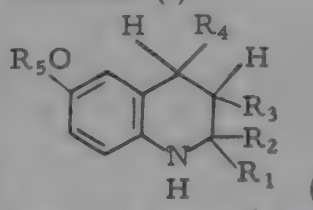
CANP D12 48207Y/27 =NL-161-341

Meat-curing solns. contg. (1,2,3,4)-tetrahydro (6-alkoxy quinolines - which reduce nitrosamine content of the cooked meat

CANADA PACKERS LTD 22.12.75-US-643558

*E13 (17.09.79) *NL7614-183 A23b-04/02*

Preserved meat produced by treating with a nitrite forms little or no nitrosamine when cooked if it is treated during or after the preserving process with a hydroquinoline of formula (I).



(I)

In the formula, R_{1-4} are H or 1-6C alkyl; and R_5 is 1-12C alkyl.

Pref. the preserved meat is treated with a pickling soln. contg. 0.001-0.2 wt. % of the 1,2,3,4-tetrahydro-6-alkoxyquinoline, such that the treated meat contains 1-200ppm. of the quinoline deriv. Fresh meat can be preserved for a year by the method. 21.12.76 as 014183 (10pp913).

Fat/meat thickness sonde - with ac bridge circuit three electrodes and three lamp indictor handle

SLAGTERIERNES FORSK (SLA -) 20.02.70-DK-000853

*+R11 (17.09.79) *DT2107-114 +G01b-07/06*

The thickness of the fat layer on a carcass is determined using a pointed probe which is inserted into the flesh and carries two electrodes insulated from each other for the measurement of the resistance of the tissue. The probe is also equipped with a space scale which enables the depth of insertion to be read. When the point penetrates the meat layer, a change of resistance indicates that the interface between fat and meat has been reached.

In order to eliminate the errors caused by variations in resistance of one type of tissue, the probe is equipped with at least three electrodes in the form of rings, the lower of which is at such a distance from the point that a true penetration of the boundary layer between fat and flesh is guaranteed before the electrode reaches this interface. The electrodes are connected in pairs across a measuring bridge and, by using a high frequency for the measuring source, variations in resistance within one layer are readily and accurately identified and eliminated. 19.2.71 as 002217 (8pp1370).

Fish processing machine - with control system for determining movement of insertion of tool in fish or varying size or type

NORDISCH MASCH R BAADER 11.03.75-DT-510421

*(15.12.78) *DT2510-421 A22c-25/14*

For the control of the moment in time a, which a tool, e. g. , a cutting tool is inserted in a fish transported at uniform speed in its length direction in a fish processing machine, in which each fish is sensed at successive positions in its length direction and pulses at uniform intervals are used for time measurement (a) the control of the instant at which each tool is inserted results automatically from the attainment a pre-set number of pulses varying for each tool and counted from the moment of sensing a precisely defined position of the fish (b) each pre-set number of pulses is obtd. by adding or subtracting two series of pulses of differing frequency the first of which arises between the first and a second precisely defined position of the fish and the second arises after the sensing of this second position. Permits control of the instant at which insertion of a tool is made at any desired position along the path of motion of the fish with greater precision than hitherto and without the need for mechanical time couplings yet with high cost for electronics. The control operates for precision processing of fish of varying size. Hartmann, F., Lyuk, H., Golnits, H. Bul. 46/15.12.78. 12.2.76. as 322603 (3pp)

Fish sorting appts. - with television camera in conveyor gap, for analysis of shape, size and colour, and sorter control
TEKHRYBPROM EXPER 03.08.77-SU-514461
(25.01.79) A22c-25/04

The installation comprises two V-shaped conveyors each formed by two belts and with a gap between their ends, and a television camera directed at the gap through a semi-transparent screen and glasses carrying mosaic colour filters.

The camera is connected via an analysis and control unit with a sorting mechanism. The mechanism consists of a spindle on , and perpendicular to the downstream conveyor, and carrying downwardly converging plates which can be pivoted to adjust the slot between the belts. The spindle is connected to an electromagnetic clutch.

The system permits evaluation of even slight colour variations in fish and the presence of spots and stripes, also comparison of shape and size.

Meat tenderising knives mounted on ram - with spring loaded ba coupling releasing knife at predetermined back thrust
MCCULLOUGH T J 23.11.77-US-854375 (16.04.76-US-677796)
(02.10.79) A22c-09

A meat tenderiser comprises a reciprocating head which carries an array of knives to penetrate a meat carried on a base-plate. A stripper surrounds the knives and strips the meat from them on the return stroke of the head.

Each knife is attached to the head by a thrust limiting module comprising a set of spring loaded balls which seat in an annular groove cut into the knife supporting shaft. When a critical thrust is reached e.g. by the knife engaging a bone the balls move radially outwards and allow the knife to become uncoupled from the head.

The knife release mechanism triggers at a preset thru to prevent damage to the blade. 23.11.77 as 854375 (11pp)

Accelerating growth of silkworms - by spraying mixed aminoac soln. contg. aspartic acid over mulberry leaves and feeding leav to silkworm
KITANO M 17.02.78-JA-017841
C03 E16 (31.08.79) A23k-01/18

Mixed amino acid soln. contg. 2 - 15 ppm of aspartic acid is sprayed over the surface of mulberry leaves and silkworm is fed with the treated mulberry leaves. Growth of silkworm is accelerated without causing harmful effect to the silkworm. The amino acid used includes aspartic acid, glutamic acid, threonine, serine, proline, glycine, alanine, valine, isoleucine, leucine, thyrodine, phenylalanine, cysteine, histidine, alginine, etc..

In an example, dil. soln. contg. the amino acid is sprayed over the surface of mulberry leaves. and after 20 days, the leaves are harvested, and, then the silkworms are fed by the leaves. By this feeding, cocoon yield is improved in the terms of the total cocoon weight and weight per cocoon. 17.2.78 as 017841 (6pp22).

HOHN ★ D13 74469B/41 ★J5 4112-82
Preventing phospholipid heat colouration - by adding aceti anhydride or alkali metal acetate to its soln. or dispersion in oil o fat
HOHNEN OIL KK 22.02.78-JA-019193
B05 C01 E11 (D23) (04.09.79) C07f-09/10 C11c-03

In heating > 0.2 wt.% soln. or dispersion of phospholipid in fats and oils at > 150°C, Ac_2O or an alkali metal salt of AcOH is added to the soln. or dispersion to prevent colouring of phospholipid. Pref. phospholipid includes those contained in soybeans, corns, corn seed oil or rapeseeds, or lecithin. The fats and oils include soybean oil, corn oil, cotton seed oil, sesame oil, sunflower oil, groundnut oil e.g. vegetable oils which are liquid at usual temp., and palm oil, etc..

Phospholipid is used in large quantities in food, medicine and feed industries since it has a surface activating action as well as antioxidant and blood-cholesterol lowering actions. Phospholipid is very unstable to heat and turns brown at > 150°C even when protected with fats and oils. Addn. of Ac_2O or an alkali metal salt of AcOH prevents the colouring. 22.2.78 as 019193 (2pp).

Conditioning freshly roasted coffee
KENCO COFFEE CO (KEN -) 16.10.67-GB-047058
*+Q31 (17.09.79) *GB1200-635 A23f-01/04 +B65b-31/02*

Freshly roasted coffee is conditioned in an enclosed vessel in which the pressure is lowered to below atmospheric pressure but not so low that a significant part of the aromatics evaporate. The coffee is then purged with an inert gas such as nitrogen for a period sufficient to remove undesired gases from the coffee cells. As the gases are released from the coffee, the pressure in the chamber increases so that the process slows down. In order to compensate for this effect, at a pressure between 10 and 25 mm.Hg above the start pressure, the vacuum is again drawn and inert gas is introduced at a rate slower than the evacuation rate until the start pressure is restored. 15.10.68 as 014706 (9pp1370).

Recovery of casein and whey from skimmed milk - by raising the protein content before acidification to reduce loss of casein
ZUID-NEDER MELKIND 19.08.74-NL-011060
*(17.09.79) *NL7411-060 A23c-21 A23j-01/20*

Method is described for obtaining casein and whey from skimmed milk which is opt. mixed with other fat-free casein contg. liq. milk prods. First the protein content of the skimmed milk or mixt. is increased by $\geq$ 10% to $\geq$ 15 wt. % by evaporation, reverse osmosis and/or ultrafiltration. The casein is pptd. as a curd by adding a casein-free liq. derived from the skimmed milk and adjusted to pH <3 by cation exchange. The casein curd is sepd. from the whey and the casein recovered from the curd.

Pref. the protein content is increased by $\geq$ 20% by ultrafiltration. The retentate of increased protein content, obtd. by ultrafiltration, can be mixed with the skimmed milk permeate from the ultrafiltration after its pH has been lowered by cation exchange. 19. 8. 74 as 011060 (5pp913).

MILE D13 00037Y/01 =NL-161-349
Textured protein concentrate as meat substitute - prepd. by aq. extn. of extruded protein to improve flavour and texture
MILES LABORATORIES INC 15.09.75-US-613090
*(D12) (17.09.79) *BE-845-331 A23j-03*

An extn. process is used to produce an albuminous material with a texture similar to that of meat and virtually neutral taste. The soluble components are extd. from extruded pieces of the albuminous material with an aq. soln. with an acidic pH. To overcome the problem of removing all of the soluble components from a dense albuminous material whilst still producing a material with a texture similar to that of meat, the material is expanded to a density within the range 85-150g/l., measured when the material has a moisture content <8%. The extn. fluid used has a pH in the range 5. 5-6 and a minimum temp. of 65 °C.

The albuminous material is pref. produced from a material contg. 35-80% albumen and 15-50% of water soluble matter and is extruded at 100-165 °C at a pressure of 7-21kg/cm^2. 26. 8. 76 as 009503 (6pp1370).

UNIL D13 06731X/04 =NL-161-350
Flavouring agent for foodstuffs esp. margarine - obtd. by heating prod. with amadori association prods. of 6-deoxyaldohexoses and alpha amino acids
UNILEVER NV 02.07.74-GB-029306
*E13 (17.09.79) *NL7507-862 A23l-01/22*

Aroma of food is improved by adding an Amadori-decomposing prod. which has a m. pt. <170 °C and is prepd. by reacting 6-deoxy-aldohexose with an α-amino-acid at <90 °C. The amt. added is 1-500mg/kg. The food and the mixed Amadori cpd. is then heated at $\geq$ 90 °C for a time sufficient for decompsn. to occur.

Pref. the Amadori prod. is derived from proline, hydroxyproline, serine or α-aminobutyric acid. The treated food is baking or cooking fat, or margarine. 2. 7. 75 as 007862 (8pp913).

Liquid-liquid or liquid-solid systems extn. unit - using pulsed selective heating and cooling of solvent streams for uniform temp. control over column height
DNEPR CHEM-TECH 27.12.76-SU-434375
G03 J01 (28.01.79) B01d-11/04 C11b-01/10

The process comprises treatment of solid stage with solvent in a column with variable temperature conditions.

To apply thermal pulsing, some of the solvent is sepd. into two streams, the one being heated and the other cooled to 15-30°C, for alternating return at various points over the column height.

The method can be used in oil extraction of vegetable source material, removal of gelatin from bones etc. for photographic use, in chemical industry etc.

Vegetable peeling appts. with rotating drum - formed with pockets for carrying vegetables through caustic soln.

HAUBNER J W 05.04.78-US-893702
*(02.10.79) A23n-07/**

A power driven rotating drum has circumferential pockets with open mouths facing outwardly. A tank holds a pool of liq. and submerges a lower portion of the drum, the periphery of the drum moving into and out of the pool on rotation.

The tank is formed with a weir adjacent where the periphery of the drum moves out of the pool. Liq. is circulated through the tank, the liq. level being established by the weir. The circulating liq. produces a current which flows through a pocket and over the weir with the pocket positioned with its mouth opposite the weir.

The appts. is partic. described as a caustic peeler for vegetables. The appts. produces minimal bruising. 5.4.78 as 893702 (6pp295)

Removable filter cover for deep fryer or chip pan - has sealing lip pressed against pan rim by cooking pressure

ROWENTA-WERKE GMBH 29.07.78-DT-U22745
P28 (01.12.79) A47j [illegible]

The cover fits on top of the pan and has a peripheral seal to contact the pan around its top edge. A fume exhaust vent through the cover is fitted with an outflow filter. Fastened on the inside face of the cover is a mounting plate, smaller in area than the cover. The peripheral seal is fitted around the edge of the mounting plate. The mounting plate is also used to contain the filter element which extends through both mounting plate and cover.

The outer circumference of the cover is pref. provided with a lifting ring in the form of an open channel between two annular flanges. The peripheral seal is pref. an annular lip, e.g. of rubber, which extends down from the lid to fit tightly inside the rim of the pan.

Used as a filter cover to prevent splashes and unpleasant fumes escaping from a deep fryer, chip pan etc. The cover is cheaper than a hinged cover as well as being easier to clean. The cover seal remains effective indenitely since gas pressure in the pan presses the annular p seal against the inside of the pan rim. 7.6.79 as 76840 (7pp448)

Tubular membrane separator for liquids - comprises hollow semipermeable yarn layer with grooved bars inserted radially forming flow passages for liquids
TOYOBO KK 16.02.78-JA-017186
J01 (29.08.79) B01d-13 B01d-53/22 C02b-01/82

A device for separating a liquid through a hollow yarn assembly disposed in a tubular casing is described. The assembly consists of a hollow yarn columnar layer and resin walls located at both ends of the columnar layer consisting of hollow yarns selectively permeable to the liquid and communicating outside the casing through one or both walls. The device has bars inserted radially into the yarn layer and extending approx. at right angles to the long axis of the layer. The bars are located near both resin walls and made hollow with grooves to form liquid passages.

Flow of liquid is uniform in the yarn layer. Dead space formation and short liq. flow are avoided. 16.2.78 as 017186 (6pp26).

Water treatment process - includes supplying salt water to electrolysis cell with cation exchange resin membrane, and using chlorine, sodium hydroxide etc. produced
ASAHI CHEMICAL IND KK 17.02.78-JA-017265
J03 (30.08.79) C02b-01

In the purificn. treatment of water, e.g. waste liquors, effluents and sewage etc. in a water-treating plant, salt water is supplied for electrolysis, to the anode chamber of an electrolysing vessel, partitioned into the anode chamber and cathode chamber with cation exchange membrane to generate NaOH at the cathode chamber and Cl_2 at the anode chamber. 5 - 70% of the NaOH obtd. is used in the form of an aq. soln., and the remaining portion of the NaOH soln. is reacted with a portion of Cl_2 to form an aq. NaClO soln. having pH of 9 - 13. A remaining portion of Cl_2 is used, so that it becomes possible to obtain three components, i.e. Cl_2, NaClO and NaOH in the treatment of water in water-treating stations, without any storage and troubles in transportation etc..

NaOH is employed for adjusting the pH value of the water to be treated, and Cl_2 and/or NaClO is used for sterilisation and decolourisation. This process is most pref. esp. in combination with activated sludge process. 17.2.78 as 017265 (5pp34)

NIPT ★ D15 74158B/41 ★J5 4110-64
Desalting and deodorising purificn. of Stephen's liquor - b introducing carbon di:oxide, adding acid, treating with weakl acidic cation exchange resin, etc.
NIPPON TENSAPSEITO KK 17.02.78-JA-016415
(D17) (30.08.79) A23k-01 C02c-05

Stephen's waste liquor, i.e. waste liquor by-produced in recovering sucrose from treacle in the prodn. of beet sugar, is desalted and deodorised without loss of useful components for use as starting material for fodder and seasoning etc..

Process comprises (a) removing lime component, e.g. by introducing CO_2 to form Ca carbonate; (b) adding an acid, e.g. H_2SO_4, H_3PO_4 and oxalic acid etc. to form insoluble salt, or using acid- or salt-type cation exchange resin; (c) treating the liquor obtd. with weakly acidic cation exchange resin, e.g. Amberlite IRC-75, Amberlite IRC-84 etc. to remove K component while hardly removing simultaneously by adsorption useful aminoacids etc.; and (d) heating the liquor at pH $<$ 7 esp. $<$ 6.5 so that the liquor is effectively deodorised without any loss of other useful components, e.g. vitamins. 17.2.78 as 016415 (4pp34).

ASAH- ★ D15 74159B/41 ★J5 4110-650
Treatment of nitrogen and/or phosphorus-contg. waste water - by adding hydrogen peroxide and calcium hydroxide, latter being in excess
ASAHI ENG KK 20.02.78-JA-017731
(30.08.79) C02c-01/40 C02c-05/04

A nitrogen- and/or phosphorus-contg. waste water, esp. prim. and sec. treated waste waters, is further subjected to advanced purification treatment by adding a mixt. comprising $Ca(OH)_2$ and H_2O_2 to it followed by agitation for 5 min. to one hr. The reaction between H_2O_2 and $Ca(OH)_2$ is equimolecular reaction, but it is pref. to use excess $Ca(OH)_2$ with H_2O_2 to obtain sufficient reaction; pref. amt. of $Ca(OH)_2$ is $>$ 2 times the theoretical amt. The reaction is thus effected under alkaline conditions, H_2O_2 is rapidly decomposed to generate nascent oxygen, and excess $Ca(OH)_2$ serves to increase coagulation settling rate of organic materials. The P components contained in the water are reacted with a portion of CaO resulted by dec. of CaO_2 to form insoluble Ca phosphate and pptd., whilst the N components are decomposed in contact with the nascent O_2 and converted to N_2 and lower mol. components which are settled by coagulation in contact with $Ca(OH)_2$. 20.2.78 as 017731 (3pp34).

NIRA ★ D15 74160B/41 ★J5 4110-651
Treating waste liquor used to develop photosensitive resin - by adding polymerisation catalyst e.g. peroxide or azo cpd. followed by coagulant
UNITIKA KK 20.02.78-JA-018721
A35 E37 G06 R23 (30.08.79) C02c-05/02 G03c-05

The method comprising (a) adding polymerising catalyst, e.g. organic peroxide, inorganic peroxide or azo cpd. etc. to cause polymerisation of polymerisable cpds., and (b) adding a coagulant, esp. salts capable of evolving multivalent metal ion, e.g. $CaCl_2$ and $MgCl_2$ etc. to cause coagulation precipitation of water-soluble polyamide, present so that lower molecular components (additives) contained in the waste liquor are almost completely co-precipitated with the water-soluble polyamide.

Inorganic peroxides are pref. used and include e.g. K persulphate, ammonium persulphate and H_2O_2 etc., and may be used in combination with assisting agent, e.g. $KHSO_3$ and ammonium ferrous sulphate. 20.2.78 as 018721 (3pp34).

Determn. of total nitrogen content of waste water - by vaporising water sample, oxidising and determining nitric oxide concn.
FUJI ELECTRIC CO LTD 18.02.78-JA-018028
E36 J04 R16 (30.08.79) G01n-33/18

Total nitrogen content in water contg. nitrogen as NH_4, NO_3^-, NO_2^-, etc. is determined by (1) vaporising the N-contg. water sample, (2) passing the vapour, together with O_2-contg. gas, over oxidising catalyst (pref. Pt catalyst heated at 700 - 900°C) to convert all N cpds. in the sample into NO, and (3) determining NO concn. by an NO-gas analyser.

Method permits continuous monitoring of total nitrogen content in household and/or industrial waste water. 18.2.78 as 018028 (4pp173).

HITG ★ D15 74208B/41 ★J5 4110-975

Fresh water prodn. from sea water or polluted water - by heat exchanging with water heated by solar energy, to effect evaporation

BABCOCK-HITACHI KK 20.02.78-JA-017602

(30.08.79) B01d-03 C02b-01/04

Sea water or polluted water is stored through a pipe in a low temp. evaporator which is maintained in an almost vacuum state. Water in a solar heat adsorber is heated with solar heat to about 60°C and the hot water is stored in a tank. The hot water is circulated from the tank through the evaporator to the solar heat adsorber. The sea water or polluted water in the evaporator is heated with the hot water, so that it is evaporated to produce a fresh water (W).

The solar heat may be used as heating means to save the fuel expense so as to provide an economical fresh water producer. The appts. may be driven without requirement of industrial equipments in places of poor water resources. 20.2.78 as 017602 (2pp35).

MITR ★ D15 74223B/41 ★J5 4110-994

Granular material for waste water treatment - produced by granulating mixt. of oil absorbent inorganic cpd., surfactant and binder, drying and heating

MITSUBISHI RAYON KK 21.02.78-JA-018747

J01 (30.08.79) B01d-15 C02c-05/02

Granular substance is produced by granulating the mixt. consisting of oil absorbent inorganic cpd., surfactant and binder, and drying and heating. Granular substance may be used for cleaning waste water contg. various mineral oils, and animal or vegetable oils in the single or mixed state. The oil may be in emulsified or dispersed state.

In an example to 800g of attapulgite clay and 5g of hexadecyldimethylbenzylammoniumchloride was added 17% alumina sol. corresp. to 200g of alumina and kneaded sufficiently, and then mixt. extruded in cylinders of 1.0 mm dia., 3 - 20mm length by twin-extrusion granulator. The mould were allowed to stand in the gas stream of 110°C for ∼ 15 hrs. and crushed to particles of 0.8 mm dia. ∼ 3 - 7 mm length. 21.2.78 as 018747 (4pp96).

MITR ★ D15 74224B/41 ★J5 4110-995

Granular material for waste water treatment - produced by coating granular substance of oil absorbent inorganic cpd. and binder, with surfactant

MITSUBISHI RAYON KK 21.02.78-JA-018748

J01 (30.08.79) B01d-15 C02c-05/02

Coated granular material is produced by coating granular substance consisting of oil absorbent inorganic cpd. and binder, or further hydrophilic organic cpd. with surfactant. The granular material may be used for cleaning waste water contg. various mineral oils, and animal and vegetable oils in a single or mixed state. Even if solids other than oils are present, treating capacity remains unaltered.

In an example to 800g of attapulgite clay was added 17% alumina sol. corresp. to 200 g of alumina and mixed sufficiently and then extruded in cylinder of 10mm dia., 3 - 20mm length by twin-extrusion granulator. The granules obtd. were allowed to stand in the gas stream of 110°C for ∼13 hrs. and then crushed to particles of ∼0.8 mm dia. and 3 - 7 mm length. Five kilograms of the particles obtd. were immersed in 5 litres of 1.0% aqueous hexadecyldimethylbenzylammoniumchloride soln. for 2 hrs., taken out and water removed by centrifugation. 21.2.78 as 018748 (4pp96).

Pure water prodn. with ion exchange resin - using alkaline regenerating soln. passed through anion exchange layer sepd. from ion exchange resin, to avoid silicate deposition

ASAHI CHEMICAL IND KK 22.02.78-JA-018503

(03.09.79) B01j-01/09 C02b-01/76

Prodn. of pure water comprises (1) passing water to be deionised through a layer of ion exchange resin (I) and (2) regenerating (I) by passing 0.1-0.4 N alkali solution through anion exchange resin sepd. from (I)-layer to the direction reverse to the direction for water-deionization

Generally, silicate adsorbed from raw water is desorbed by regeneration of (I), concentrated in waste regenerant and then deposited as ppte. in other known methods. Thus precipitated silicate must be removed from waste regenerant before it is discarded. According to the present method, silicate does not deposit in waste regenerant.

The pref. combinations of (I) are(i) strong acidic cation exchange resin and II-type strong basic anionexchange resin and (ii) strong acidic cation exchange resin, strong basic anion exchange resin and weak basic anion exchange resin. 22.2.78 as 018503 (4pp42).

JAPE ★ D15 74401B/41 ★J5 4112-553

Solidification of sludge into granules - using hydrophilic crosslinking water swellable polymer initially, then recycling the obtd. granules in place of the polymer

JAPAN EXLAN KK 20.02.78-JA-019526

A81 C04 (03.09.79) B01j-01 C02c-03

In solidifying mud-like matters, e.g. sludge from the treatment of organic waste waters, e.g. municipal sewage, etc. or sludge accumulated at the bottom of rivers etc. into granules, a hydrophilic cross-linking polymer having water swellability (the wt. of the polymer after swelling/the wt. of the polymer prior to swelling) 10 - 320 times, is used. The copolymer is e.g. of acrylic acid and divinylbenzene, alkali-hydrolysed acrylonitrile polymer cross-linked with formaldehyde, acrylamide-bearing copolymer cross-linked with formaldehyde, PVA, cross-linked with epichlorhydrin etc..

The improvement comprising previously adding the polymer to the mud-like matter followed by drying to give a granular solidified mixture; thereafter adding the granular solidified mixt. to the mud-like matter in the place of the polymer followed by drying to give further granulated solidified mixt.; and further repeating in succession above procedure. The amt. of polymer used relative to the mud-like matter is greatly reduced, and the process becomes very economical. The final granular solidified mixt. may be reused as fertiliser etc.. 20.2.78 as 019526 (7pp34).

JAPE ★ D15 74402B/41 ★J5 4112-554

Solidification of sludge into granules - using hydrophilic, crosslinked water-swellable polymer

JAPAN EXLAN KK 20.02.78-JA-019527

A81 C04 (03.09.79) B01j-01 C02c-03

Mud-like material e.g. surplus sludge from the activated sludge treatment of organic waste water, e,g. municipal sewage, and industrial waste water etc., Hedoro, i.e. sludge accumulated at the bottom of rivers, and organic and inorganic sludge produced in plants etc., are effectively solidified into granules by adding thereto a hydrophilic cross-linked polymer having water-swellability (wt. of polymer after swelling/wt. of the polymer prior to swelling) of 10 - 320 and the granular size of 40-1,000 μ. The polymer is e.g. divinylbenzene - acrylic acid copolymer (salt), alkali-hydrolysed acrylonitrile polymer crosslinked with formaldehyde, PVA crosslinked with epichlorhydrin, 2-hydroxyethylmethacrylate - ethyleneglycoldimethacrylate copolymer of N, N-dimethylaminoethylmethacrylate - N, N'-methylenebisacrylamide copolymer. It is used in an amt. of ≯1.0 wt.% based on water content of the mud-like matters.

Evaporation of water from the mud-like material is greatly accelerated and generation of bad odour is effectively suppressed. 20.2.78 as 019527 (6pp34).

KANK- ★ D15 74403B/41 ★J5 4112-556

Treating organic effluent using hydrogen peroxide - in presence of iron salt catalyst, adding excess ferrous salt to decompose remaining peroxide and precipitating excess iron as hydroxide

KANKYO ENG KK 22.02.78-JA-018605

(03.09.79) C02c-05

In treatment of organic effluent with H_2O_2 in the presence of iron salt catalyst to decompose by oxidn. organic matters present the improvement comprises adding excess ferrous salt, e.g. $FeSO_4$, $FeCl_2$ etc. to the oxidn.-treated water followed by adjusting its pH to > 6 with alkali, e.g. NaOH, KOH and $Ca(OH)_2$ etc. to decompose, by redn., unreacted H_2O_2, aerating it while maintaining its pH value at > 6 to oxidise an unreacted Fe^{2+} to Fe^{3+} and to ppte. it as $Fe(OH)_3$.

This ensures that remaining H_2O_2 is completely removed within short period without any increase in volume of reaction vessel and H_2O_2-decomposing vessel and further without any accurate control in amt. of H_2O_2 to be injected according to COD Mn of the water to be treated. 22.2.78 as 018605 (3pp34).

EBAI ★ D15 74404B/41 ★J5 4112-557
Dewatering sludge from e.g. water, sewage or night soil treatment - after addn. of hydrated calcium chloride, hydrogen peroxide and pH-adjusting agent
EBARA INFILCO KK 22.02.78-JA-019419
(03.09.79) B01d-21/ C02c-03*

A difficultly filterable sludge composed mainly of metal hydroxides, resulting from the treatment of water, sewage, night soil etc., is effectively dewatered with increased dewatering rate and decreased amt. of dewatered filter cake by adding $\geqslant$10 (10 to 100) wt.% of $CaCl_2.2H_2O$ and $\geqslant$2 (2 to 15) wt.% of H_2O_2 based on dried solids content of the sludge, and subsequently adding a pH-adjusting agent, e.g. HCl, H_2SO_4, NaOH, Na_2CO_3 etc. to adjust the pH to 4 to 6, so that the oxidising strength of the H_2O_2 becomes strong, and characteristics of the filtrate are also improved.

The sepd. liquor (the filtrate) thus obtd. is almost odourless and neutral and hardly contains harmful components, so it can be discharged. In the case of sewage sludge treatment, the sepd. liquor is directly recirculated to a concentrating vessel without recirculating it initially to a settling pond, due to the fact that its COD content is low. 22.2.78 as 019419 (3pp34).

Sepn. of oil from water - using a settler and filters in series to prevent oil contaminating the treated water
MACH DEVENTER BV (GEUR-) 14.12.73-NL-017147
*J01 (17.09.79) *NL7317-147 B01d-17/02 B01d-21 B01d-35/12*

A sepn. vessel for lighter and heavier liquids such as oil and water consists of a vertical chamber divided into three zones, a central sepn. zone, an upper collection and discharge zone for the lighter fluid and a lower collection and discharge zone for the heavier fluid. The lower zone incorporates a bank of filters placed in series, the filter material permitting the passage of the heavier fluid alone. At the top of the compartment between each filter layer, there is channel which leads back into the sepn. zone.

The filter bank is so assembled that the channels from each compartment can be selectively isolated by means of an isolating mechanism which enables the individual filter layers to be washed with a reverse flow of clean water introduced via the discharge port in the collection chamber.

This enables the sepn. vessel to remain in operation for long periods without the necessity of periodically shutting down the unit to replace the filter banks. 14.12.73 as 017417 (8pp1370).

Drinking water mineralisation - by contacting with saturated reagent solution contg. solid phase, used in spaceships etc.
MOSC ENG-CONS INST 10.03.76-SU-331159
(30.12.78) C02b-07

The process used in closed ecological systems, e.g. spaceship etc. comprises contacting, through an osmotic membrane, with a satd. soln. of chemical reagent.

For continuity and high product quality, the contacting saturated soln. contains solid phase.

The mineraliser is filled with solid phase of $NaHCO_3$ salt in equilibrium with its saturated soln. The salt volume of 53ml. corresponds to 90g of salt. Feed of distillate, and the concentration difference between the two sides of the membrane, result in entry of water and displacement of soln. the volume of which is measured in the usual way. Thus on dosing for 1 and 24 hours at a soln. displacement of 0.5ml/h., the displaced soln. concentration is 92g/l in both cases.

WATE= ★ D15 75029B/41 ★SU -643-170
Drainage filter for surface water - has filtration surface increased by standard large area, fine cleaning partition assembly
WATER POLY MAT 01.04.77-SU-472309
J01 (28.01.79) B01d-23/16

The filter comprises a coarse-cleaning element made as a cylindrical casing with gravel packing and water openings, a drain, and a fine-cleaning element in the coarse-cleaning element and at the end of the drain. To increase throughput in the fine-cleaning element, this is made as a cross-piece with filter partitions.

The dirty water reaching the fine-cleaning element is drawn through the partitions into the drain. This technique facilitates installation of partitions of a single standard size with a large total filtration area, thus also simplifying the production of standard filter partitions. When the holes in the cross-piece are twice the diameter of the drain hole, the total filter surface is 20 times the cross-sectional area of the drain branch.

Sea water purification by reverse osmosis - after mechanical prefilter with flushing by purified water after use
PERMO SA 01.06.78-US-911959
(02.10.79) B01d-13 C02b-01/82

Potable water is recovered from seawater by initially passing it through a mechanical filter pref. comprising 4 stages having reducing pore size. Filtered water is then pumped at high pressure to a reverse osmosis membrane which removes dissolved salts to form a potable water product which is stored in a tank. A reject flow is taken from the upstream side of the membrane and is released at a controlled back-pressure to regulate the conversion efficiency of the membrane to a value which prevents the formation on it of sulphates or carbonates.

When the plant is to be shut-down the entire system is flushed and filled with potable water from the reservoir to retard the growth of marine microorganisms in the system.

Appts. produces potable water for use on an off-shore oil rig. Contamination with impurities or microorganisms is retarded. 1.6.78 as 911959 (11pp295)

Membrane potential of vesicles determn. - from change of lipophilic ion concn.
ASAHI KASEI KOGYO 05.03.79-JA-025251 (23.03.78-JA-032338)
J04 R16 R27 (04.10.79) C12k-01/04 G01n-13 G01n-27/40 G01n-33/16 G06f-15/46

The membrane potentials of vesicles are measured by dipping an electrode, which responds selectively to lipophilic ions are dissolved and vesicles are suspended. The rate of change of the lipophilic ion concentration, caused by the presence of the vesicles, in measured as a change of the electrode potential and its rate in unit time indicates the membrane potential of the vesicles.

A large number of samples can be tested by this method in a short time. The method is equally suitable for vesicles with a low membrane potential. 21.3.79 as 911033 (56pp39).

Reagent for assay of pyruvate - contains pyruvate oxidase and pref. co-factors, phosphate and metal salt activator
TOYO JOZO KK 14.07.78-JA-086350 (25.03.78-JA-034687)
B04 J04 R16 (04.10.79) C07g-07/02 C12d-13/10 G01n-31/14 G01n-33/16

Analytical reagent is a reaction system contg. pyruvate oxidase (I). Pref. it also contains flavine-adenine-dinucleotide (FAD), thiamine pyrophosphate (II), phosphate, and a salt providing Ca, Co, Mg and/or Mn ions.

Opt. the reagent also contains an indicator for H_2O_2, esp. a peroxidase, 4-aminoantipyrine and phenol or N, N-dimethylaniline or homovanillic acid. Pref. (I) is derived from a Pediococcus, Streptococcus or Aerococcus species, specifically P. sp. B-0667 (FERM-P 4438); S. sp. B-0668 (FERM-P 4439); A. viridans (1FO-12219) or A. viridans (1FO-12317).

Used for analysis of pyruvic acid (or pyruvate-generating systems), esp. for diagnostic purposes. 22.3.79 as 911481(40pp1251).

Non-return device for archimedean screw press - with reversed helical blades, used partic. for treating grapes
MERCIER-SANCHEZ 29.12.77-FR-039692
P71 Q56 Q66 (31.08.79) B30b-09/14 F04d-29/16 F16k-15

Non-return device for continuous presses, partic. those used for the treatment of grapes, is associated with an Archimedean screw rotating in a feed hopper and a cylindrical channel; at least one blade of the screw is reversed with respect to the remainder.

The press comprises a feed hopper, a cylindrical channel, the screw driven by the motor and a flap valve with a hydraulic jack regulator. The screw is in two portions so that one part is in the hopper and the remainder in the channel. The non-return device is between the two portions and consists of two blades with a reversed thread, mounted by means of flanges on the portions (3a, 3b) of th cylindrical channel. The part of the scrw is prolonged b a shaft passing through the device; the part is keyed to this shaft and kept in position by a nut screwed to its end

The normal progression of the material in the press i practically unrestricted and a notable economy in energy is achieved. 29.12.77 as 039692 (7pp519)

Microcalorimeter for biological experiments in controlled atmos. supplied with small flow of selected gas at controlled temp. (S 30.7.79)
AGENCE NAT VALORISATION 28.12.77-FR-039933
R14 +R16 (31.08.79) C12k-01 G01k-17 G01n-25/20 G01n-33/1

The microcalorimeter has a measuring cell to contain culture medium for the experiment and an identical reference cell. The cells are housed in a thermostatically controlled, thermally insulated block of material, esp. metal, which is a good heat conductor. Each cell has a multi-thermocouple temp. detector. Throughout an experiment, the head space above the culture medium in the sealed cell is filled with a gas of controlled compsn. A very low flow rate of the gas, at a temp. close to that of the block, is passed through the head space from a source outside the caldrimeter. Within the cell, the experiment takes place in controlled atmos. conditions.

The head space is pref. connected to the exterior of the thermocouple by two pipes, one for inflow and the other for outflow of gas. Each cell pref. takes the form of a shallow, cylindrical dish which rests upon the temp. detector. Through the top sealing cover of the cell are passed inflow and outflow pipes for gas, drive shaft for rotary agitator and graduated syringe(s) for injection of reagents.

The gas can be air for aerobic cultures, an inert gas to purge out gaseous cell prods. such as H_2, H_2S, methane etc., or CO_2 for the study of photosynthesis. 28.12.77 as 039933 (21pp448)

Apparatus for cultivating microorganisms such as yeast - including chamber for concentrating suspension of microorganisms giving biomass with low residual content of medium
PROTEINS BIOSYNTH 31.03.78-SU-597988
(10.10.79) C12k-01/10

Microorganisms are cultivated in an appts. which includes a vertical column to which are fed a culture medium and an inoculstive biomass. The column is divided into sections by transverse perforated partitions. An aerator is included in the bottom section while the uppermost section is used to concentrate the suspended microorganisms.

This concn. is effected using a horizontal chamber which converges towards a discharge nozzle for the concentrated suspension and also includes a partition to restrict the cross sectional area and to define a clarified culture liq. reservoir. Floating packing pieces inert to the culture medium are located in each column between upper and lowermost sections.

The appts. is used to cultivate microorganisms, e.g. yeast, on an industrial scale. The resulting biomass has a low residual content of culture media and thus requires less subsequent processing. 5.3.79 as 007738 (6pp245)

Forming hybrid bacteria - by transducing packaged bacterial plasmid into Escherichia coli bacteria
BIOTECHN FORSCH MBH 31.03.78-DT-814039
B04 (10.10.79) C12k-01

Hybrid bacteria are formed by producing a hybrid plasmid from a bacterial plasmid of not more than 21 megadaltons and having one or more COS sites of a lambda or lambdoid phage and from a DNA fragment. The plasmid is packaged with the lysate of a lambda or lambdoid phage and then transduced into Escherichia coli.

Used for formation of bacteria which can produce antibiotics or human hormones. The process allows larger DNA molecules to be transduced into the bacteria. 30.3.7 as 11241 (11pp916)

nactivation of enzymes - by treating active carbon carrier with an
rganic inactivator, and displacing the inactivator with the enzyme
ILLINOIS WATER TREA 03.10.77-US-838544
(14.07.79) C07g-07/02 C12d-13/10

An active carbon carrier is treated with a soln. contg. an organic inactivator and thereby, a complex compound having a reactive radical is produced on a surface of the active carbon carrier, and the complex compound on the active carbon carrier is treated with a soln. contg. the enzyme and by replacing the organic inactivator with the enzyme, a complex compound of carbon-enzyme is obtained. The complex compound of carbon-enzyme is separated from a reaction system by fractionating.

The organic inactivator is chosen from water soluble carbodiimide, quaternary ammonium salt of 1-cyclohexyl-3-(2-amino.ethyl)-carbodiimide or 1-cyclohexyl-3-(2-morpholino.ethyl)-carbodiimide-metho-P-toluene-sulphonate.

The process is used for purifying an organic compound which is produced by enzymatic reaction. 3.10.78 as 121916 (9pp15).

Clear, tasty, sweet and sour seasoning prodn. - by autolysing Acetobacter bacteria, opt. in protease, opt. heating, removing insolubles, and concentrating and/or drying
AJINOMOTO KK 15.02.78-JA-016212
(D13) (29.08.79) A23l-01/28

The method comprises autolysing acetic acid bacteria belonging to Acetobacter, opt. in the presence of protease; opt. heating it; removing insoluble residue from the extract; and concentrating and/or drying the extract. The clear extract shows good strong taste, good body, sweet-sour fragrance, and is inexpensive. It is free of yeast odour and can be used as a seasoning.

The bacterial strain is Acetobacter acetii IFO 3281, A. lancens IFO 3297, A. aciendis IFO 3299, etc.. The bacteria is cultured aerobically and is then formed into an aq. suspension contg. 3-30 g/dl. The suspension also contains a promoting agent for the autolysis (e.g. ethylacetate, toluene, etc.) in an amt. of 1-3 % and the autolysis is at 30-60°C and pH 4 - 10 for 10-50 hrs.. 15.2.78 as 016212 (3pp5).

AJIN ★ D16 74123B/41 ★J5 4110-364
Bacterial extract prepn., suutable for seasoning use - by autolysing Bacillus subtilis, opt. heating, and purifying to give 5'-ribonucleotide-contg. prod.
AJINOMOTO KK 15.02.78-JA-016213
(D13) (29.08.79) A23l-01/28

Method comprising autolysing bacterial body belonging to Bacillus subtilis opt. in the presence of protease, if necessary heating, removing insoluble residue from the extract and concentrating and/or drying the extract. The extract, contg. large amts. of 5'-ribonucleotide, has a strong good taste, round sourness and specific good taste and flavour originating from 'natto' bacteria. It is free of yeast odour and can be used as the material for seasoning.

Pref. 'natto' bacteria are used;practically Bacillus subtilis IAM 1028, IAM 1033, etc. are suitable. The bacteria are cultured aerobically as usual and after the culture, bacterial body is converted into an aq. suspension contg. 3-30 g/dl. In the suspension a promoting agent for autolysis (e.g. ethylacetate, toluene, etc.) is added 1-3 % and the autolysis is effected at 30-60°C at pH 4.0-10.0 for 10-50 hours. The autolysis can be also promoted by the presence of enzymes such as protease, peptidase, etc.. 15.2.78 as 016213 (3pp5).

*+R16 (17.09.79) *DT2453-858 C12k-01/10*

sample is analysed for possible microorganisms by mix-
g a given quantity of the sample with a specific quantity
nutrient for the particular microorganism, incubating
e mixt. and then examining the product for growing col-
ies. An indicator may be included to assist in the exam-
ation. For anaerobic bacteria, this process is carried
t in a syringe type holder with a rectangular type cross-
ection and transparent walls, the sample and the nutrient
eing drawn into the syringe via an opening in the end of
e holder.

The syringe plunger ensures that the conditions during
ampling and incubation remain anaerobic and the trans-
arent walls enable the subsequent examination for colon-
es to be carried out without removing the culture from
he holder. The device is simple and economic. 13.11.74

Wine maturation quality control - includes measuring changes in
edox potential for early detection of bacterial contamination etc.
AS MOLD MYCOLOGY 22.09.76-SU-407825
R16 (05.12.78) G01n-33/14

The quality control is improved by carrying out the redox measurements at 10-15 day intervals (the first measurement 8-12 days after the beginning of the storage). A 10-20% decrease of the redox potential of wine indicates worsening of its quality caused by the action of microorganisms or enzymes, or by the presence of heavy metal salts, etc.

These effects can be counteracted by the known method when detected early.

Alcohol three-column distillation unit control - by fermented mash distillate flow regulation based on alcohol concentration in fractionation column control zone
FOOD IND AUTOM RES 02.08.77-SU-514386
(22.02.79) C12f-01/02

The control of the three-column alcohol prodn. unit is improved by maintaining a given flow rate of fermented mash distillate. The flow is set as a function of a parameter characterising the concentration of alcohol in the control zone of the rectification column. The method can also be used in petrochemical industry.

When it is necessary to raise the output of the unit, the setting of the controller is raised so that the draw-off of rectified alcohol is augmented. The flow rate of the intermediate fraction remains unaltered causing a change in the concn. of the control zone in rectification column. The transducer signal resets the flow of fermented mash distillate into the purification column, thus increasing the delivery of the intermediate fraction into the rectifying column to restore the balance.

Sugar beet washer and dryer

CHEMADEX (PRZ -) 08.05.70-PO-140493

*(04.10.79) *DT2123-095 A23n-13*

A water separator for use on root crops, such as sugar beet, after their washing operation, consists of an endless belt which is wrapped around two return drums. The belt consists of parallel V-belts and the root crops are moved along on the wide base of the belts. Support drums between the return drums are partly smooth and partly with V-grooves to act as guides for the belts. A jockey pulley, applied to the bottom strand, maintains the correct tension.

This has a high dewatering efficiency and its gentle movement over the support drums causes no damage to the root crops. Blockages of the gaps between the V-belts cannot occur. 10. 5. 71 as 123095 (6pp39)

Controlled drive for diffusion appts. worm in sugar beet processing has output from command unit to reference rotational speed sette at input to thyristor converter

KRASND POLY 14.05.76-SU-360572

(30.12.78) C13c-01/08

The known controlled drive for the worm of a diffusion apparatus contains a command unit, thyristor converter and d.c. motor. For more intensive diffusion, a worm rotational speed setter is introduced in order to time worm acceleration and deceleration. The cyclical rotation of the worm sets up pulsatile movement of the liquid and solid phases. This reduces begasse sugar loss by 15-20% in processing sugar-beet for the foodstuffs ind.

The timing is in accordance with formulae. The run-up and deceleration time are: $T_r = T_d = (\omega_{max} - \omega_{min})$ ε, where ε is rotational acceleration. The lag between run-up and run-down $T_l = T_r \times \left[\frac{\omega_r - \omega_{min}}{\omega_{max} - \omega_r} - 1\right]$ if $\omega_r > \omega_{av}$ ω_{av} is mean rotational speed in rad/sec. But if $\omega_r < \omega_{av}$, the lag is $T_l = T_r \cdot \left[\frac{\omega_{max} - \omega_r}{\omega_r - \omega_{min}} - 1\right]$.

Prodn. of alkyl ether derivs. of poly:galactomannan gum - with good stability and viscosity properties for use in petroleum, textile, printing and pharmaceutical industries

CELANESE CORP 05.01.78-US-867269

A11 B04 H01 (A97) (02.10.79) C08b-37

Prepn. of alkyl ethers of polygalactomannan, gum by reacting polygalactomannan gum (I) with alkyl halide (II) is improved by carrying out the reaction in the presence of at least a stoichiometric quantity of a strongly basic metal hydroxide (based on wt. of (II)), and 0.05-5 wt.% of a non-reactive water soluble quaternary ammonium halide phase-transfer agent (based on wt. of (I)). Reaction is in an aq. medium at 10-100°C fpr a period sufficient to achieve a degree of substitution by alkyl ether gps. of 0.0 -3.

The prods. have a greater degree of clarity, and are more stable under extreme conditions of pH and in the presence of polyvalent metal ions. The prods. are superio to conventional gums for application in petroleum, textile, printing, paper, food and pharmaceutical industries. The prods. have excellent viscosity and suspending properties for application as gelling agents in hydraulic well-treating fluid compsns. They have resistance to bacterial degradation. 5.1.78 as 867269 (5pp954)

A transparent, highly viscous, liquid hair shampoo comprises (a) 1-10 wt.% of $\geqslant$1 cpd. of formula $R_1R_2CH\text{-}O\text{-}(CH_2CH_2O)_nH$ (where R_1 is 8-14C alkyl, R_2 is H or 1-7C alkyl and n for 0-10 wt.% of component A is 0-1, for 90-100 wt.% of component A is 2-4 (50-100 wt% of A is 3) and for 0-10 wt.% of component A is 5 or more), (b) 5-40 wt.% of an 11-15C alkylsulphate 2-3C alkylolamine salt and (c) water.

The shampoo has good cleansing and conditioning properties. 14.9.76 as 641206 (5pp068)

CYTH- ★ D21 73890B/41 ★FR 2413-093
Slimming products contg. extract of Centella asiatica - used as lotion or cream applied locally and externally
CYTHO SARL 29.12.77-FR-039623
(31.08.79) A61k-35/78

The product is pref. applied as a lotion or a cream esp. contg. a 3-15% 70° alcoholic tincture of Centella Asiatica (I) equiv. to 10% of dry (I) extract. It also pref. contains volatile substances aiding penetration esp. camphor and menthol in amt. 0.5-5%. The products pref. also contain sodium and calcium chlorides. The lotion is pref. diluted with water immediately before use and applied with cloth or tissue. The cream is applied directly.

The products are effective, easy to apply and simultaneously made the sub-cutaneous tissues firmer. 29.12.77 as039623 (5pp597)

MIYA/ ★ D21 74115B/41 ★J5 4110-335
Face powder contg. lecithin and opt. organic acid - is easy to apply and gives water repellant coating film free of glossiness
MIYAZOE T 17.02.78-JA-016621
E19 (29.08.79) A61k-07/02

Cosmetics contain lecithin and opt. water soluble organic acid. They adhere well to a wet puff and can be spread on the face easily. The coating film is water repellent and stable. Water soluble organic acid not only prevents the decomposition of lecithin with alkali, but also adjusts the pH of the cosmetics to the proper range. Thus the cosmetics are safe and nontoxic and show excellent protecting effect on the skin. Oily glossiness of the coating film is suppressed.

The major components of makeup cosmetics are talc and/or mica and they have usually pH 8-9. While skin has pH ca. 6.5 and with water soluble organic acid (e.g. citric acid, tartaric acid, malic acid, etc.) pH of the makeup cosmetics can be brought to ca. 6.5. Practically lecithin is combined 0.5-3 w/w% pref. ca. 1 w/w% and water soluble organic acid is combined ca. 2 w/w% on the make up cosmetics. 17.2.78 as 016621 (2pp5).

AKIY/ ★ D21 74116B/41 ★J5 4110-336
Prepn. of skin protective agent for use in cosmetics - by treating collagen with protease and emulsifying resulting athero-collagen in water and oil or fat
AKIYAMA T 16.02.78-JA-016750
(29.08.79) A61k-07

The method comprises treating collagen with protease for digestion-removing the theropeptides which are present at the ends of collagen molecules and emulsifying thus obtd. athero-collagen free of antigenic activity, in a mixt. of water and oil or fat.

Skin cosmetics which show excellent skin-treating effect without harmful side effects such as allergy, etc., can be obtained. Atherocollagen is also useful as the material for artificial internal organs. The effect of atherocollagen on skin can be promoted by combining mucopolysaccharide and the skin cosmetics are favourably mfd. in oil-in-water type emulsion. 16.2.78 as 016750 (4pp5).

NONO- ★ D21 74117B/41 ★J5 4110-337
Hair dye contg. tyrosine and tyrosinase - which on mixing and oxidn. give dopa-quinone which is condensed to give natural colourant, melanin
NONOGAWA SHOJI YG 14.02.78-JA-015801
E14 (D16) (29.08.79) A61k-07/13

Hair dye is composed of a first compsn. contg. tyrosine and a second compsn. contg. tyrosinase.

Tyrosinase itself has no chromophore in its structure and is oxidised with tyrosinase to dopa-quinone, which is condensed or polymerised repeatedly to form melanin. Thus formed melanin is the same pigment present in human body and hair can be dyed with it in natural colour safely.

Conventionally hair dyes have been composed of synthetic dye or plant pigment and in dyeing hair with those hair dyes the use of acid, alkali or oxidant has been required for the colour development. Further their colour has been unnatural and their safety has not been confirmed satisfactorily. This prod. is free of these problems. Practically crystalline tyrosinase should be dissolved in aq. buffer solution of pH 6-7 directly before the dyeing for preventing the loss of the enzymic activity. 14.2.78 as 015801 (3pp5).

NAKA/ ★ D21 74161B/41 ★J5 4110-660
Prodn. of piled or granulated material for applying cosmetics - by applying soln. or emulsion of blocked isocyanate cpd. to piles or granules and/or base material and heat-treating to improve adhesion
NAKAMURA K 20.02.78-JA-018281
A96 P24 (A25) (30.08.79) A46d-01

Piled or granulated material suitable for use as e.g. powder puff in cosmetics, exhibiting excellent anchoring effect (of piles or granules) even in such case that the layer of adhesive is very thin, is produced by previously adhering soln. or emulsion of block isocyanate cpd. to piles or granules to be set-up, and/or applying an adhesive layer contg. the block isocyanate cpd. on the surface of base material, or followed by heat treatment so as to improve adhesive strength between the piles (or granules) and the base material.

The isocyanate cpds. are e.g. diphenylmethanediisocyanate, hexamethylenediiosocyanate, 2,2,4-trimethylhexamethylenediisocyanate, dicyclohexylmethanediisocyanate etc. and the blocking agents are, e.g. MeOH, EtOH, ethyleneimine, n-pentanol, iso-propyl alcohol, phenol, p-nitrophenol, m-cresol, acetylacetone, ethyl acetoacetate and ε-caprolactam etc., 20.2.78 as 018281 (3pp34).

KANE ★ D21 74503B/41 ★J5 4112-906
Powdered shampoo compsn. - comprising zinc sebacate, poly:ol(s) and alkali salt of alcohol sulphate ester
KANEBO KK 23.02.78-JA-020151
A96 E12 (E17) (04.09.79) A61k-07/06 C11d-10/02

Compsn. consists of 1 - 10 wt.% zinc sebacate powder of max. particle size 10μ and mean particle size $< 3\mu$. 1 - 10 wt.% of $\geqslant$1 polyol selected from propylene-glycol, 1,3-butane diol and glycerin and 77 - 95 wt.% alkali salt of higher alcohol sulphate ester $ROSO_3M$ (where R is alkyl or alkenyl of 10 - 18C, M is Na or K).

Pref. zinc sebacate is used in amt. of 1 - 10 wt.% (pref. 3 - 7 wt.%). The polyol is used in amt. 1 - 10 wt.% (3 - 7 wt.%). The sulphate is pref. used in amt. 77 - 95 wt.% (80 - 90 wt.%).

The compsn. is storage stable for long periods without forming a paste or cake. It is easily dispersible or sol. in water, and does not stimulate the skin. It has high cleaning and deodorisation power. 23.2.78 as 020151 pp170).

atty acid amidoethylpolyoxyethylenyl phosphates for cosmetic oaps
KAWAKEN FINE CHEMIC 10.11.72-JA-112678
*E11 (19.09.79) *J49072-305 +C11d-09/34*

osmetic soaps are prepd. with $RNHCH_2CH(R_1)(OCH_2-CH_2)_n$ $P(O)(OX)OY$ (R = 9-20C acyl, R_1 = H, or Me n = 0-20, X nd Y = $RNCH_2CH(R_1)(OCH_2CH_2)_n$, H, Na, K, NH_4 or alkanol amine) and satd. or unsatd. fatty acid Na salts. These oaps have better rinsing properties than conventional oaps.

In an example fatty acid monoisopropanolamide ethoxy- ate 30 pts. and P_2O_5 2.5 pts. were reacted, and the prod- ct was combined with triethanolamine phosphate and a asic soap material and made into soap cakes. 10.11.72 s 112678 C11d-9/34 (19.9.79) KAWAKEN FINE CHEM. 4pp) (J4 7112678)

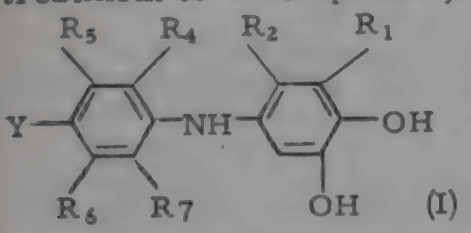
NATT D21 23268V/13 = NL-161-357
Hair setting compsns. - comprising solns. of sulphonated styrene (co)poly-mers
NAT STARCH & CHEM CORP 13.09.72-US-288530
*A96 (A13) (17.09.79) *DT2340-590 A61k-07/11*

Hair-treating prepn. comprises a 0.1-10 wt.% aq. soln. or aq. alcoholic soln. of a sulphonated polystyrene or co-polymer of styrene and an olefinically unsatd. monomer, of mol. wt. $6000-7\times10^6$. A salt of the polymer may also be used. The hair is treated with the soln. shaped and arranged, and dried.

Pref. a Na salt of sulphonated polystyrene of mol. wt. $8\times10^4-5\times10^5$, or a sulphonated styrene-methylmethacrylate copolymer or salt is used. The soln. can be used in the form of a rapid-breaking foam, or if the sulphonated polymer has a mol. wt. $\ngtr 10^5$ the soln. can be used as an aerosol spray. 23.8.73 as 011607 (7pp913).

OREA D21 13680S/07 = NL-161-490
Leuco derivs of indoanilines and indophenols - for dyeing keratinic fibres
L'OREAL SA 11.08.69-LU-059265
*A14 E14 (A96 E24) (17.09.79) *BE-754-649 A61k-07/13 C07c-91/42 C07c-103/44 C07c-127/19 C09b-57 +C07c-93/14*

Hair colouring prepn. for use with living hair contains a leuco dye of formula (I) as an aq. (alcoholic) soln. The prepn. can give even colouration overall or partial colouration, with a striking shine without requiring after-treatment to develop the dye.



(I)

In the formula, Y is OH or NH_2; R_{1-3} are H, halo, 1-4C alkyl or alkoxy, ureido or 1-4 C acylamino, and R_2 is also $-NHR_3$, R_3 is H, 1-4C (hydroxy)alkyl or carbamoylmethyl; R_{4-7} are H, and 1-4C alkyl and alkoxy. The acid addn. salts of (I) can also be used. Opt. the prepn. contains cosmetic resin(s). If the soln. contains no resin, the cpds. 4-hydroxy-4'-amino-3'-methyl diphenylamine and 4-hydroxy-4'-aminodiphenylamine are specifically excluded.

Secondary claim specifically excludes the following combinations: (1) R_2 is $-NHR_3$ and R_3 is H, (2) Y is OH, and R_2 is H, halo, 1-4C alkyl or alkoxy. (3) Y is NH_2, and $\geqslant 2$ of R_{1-3} are H, and (4) Y is NH_2 and R_2, R_{4-7} are H. 10.8.70 as 011768 (11pp913).

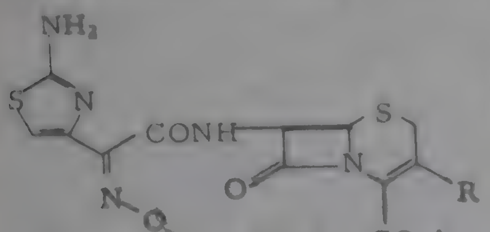
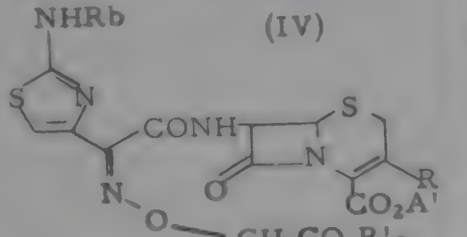
Cephalosporins of formula (I), syn isomers, and their salts with organic or inorganic acids are new (R is 1-3C alkyl or CH_2SR_1. A is H, an equiv. of an alkali or alkaline earth metal, Mg, NH_4 or amine base, or is an easily-cleaved ester gp. A_1 is as A or 1-3C alkyl, R_1 is 5-6 membered heterocycle with 1-4 S, O or N atoms and may be substd.).



(I)



(IV)

Also new are intermediates (IV) (R'_a is 1-3C alkyl or easily-cleaved ester gp. Rb is amino-protecting gp. A' is H or easily-cleaved ester gp.).

(I) are antibiotics effective against Gram. neg. or pos. species, esp. penicillin-resistant staphylococci, coliforms, Klebsiella, Proteus and Salmonella. They are useful therapeutically and for sterilising surgical instruments 6.4.79 as 875379 (36pp1251)

COLG ★ D22 73650B/41 ★ BE -876-791

Throwaway sanitary products e.g. napkin - comprising impermeable backing sheet, absorbent wad, and upper sheet of nonwoven water repellent material

COLGATE PALMOLIVE CO 09.06.78-US-913998

A96 F07 P21 P32 (01.10.79) A41b A61f

Throwaway prod., such as a nappy, sanitary towel or a protecting slip, comprises the usual, impermeable backing sheet, an absorbent was and an upper sheet of a nonwoven, water repelling material, such as polypropylene or polyethylene fibres. This upper layer is applied to the wad by linear stamping with adhesives or by hot sealing, so that the liq. can enter the wad immediately and does not remain on the surface for any length of time.

The upper sheet is applied so that spaced, parallel, elevated ridges are formed with channels in between for collecting the liq. Rapid penetration of the liq. is achieved whilst retaining only a small quantity and without any rewetting by the liq. 6.6.79 as 876791 (9pp519)

COLG ★ D22 73668B/41 ★ BE -876-865

Throwaway sanitary articles - with upper, nonwoven sheet of water-repellent material which is coated with a surfactant

COLGATE PALMOLIVE CO 08.06.78-US-913714

A96 F07 P21 P32 (01.10.79) A41b A61f

Upper layer, for prods. such as nappies and sanitary towels to be thrown away after use, when made of a water-repellent material is not altogether satisfactory when dealing with a sudden flow of a liq. such as urine.

The new material is permeable to air, repels water, is non-woven and is based on polyamide, polypropylene or polyester. The upper sheet covers a wad of absorbent material resting on a water-impermeable film. The sheet is covered with a non-ionic surface active material, pref. a condensn. prod. of 10 moles of ethylene oxide with octyl phenol to allow of a more rapid penetration of fluid. Only spaced zones are covered by the surfactant either by spraying or by printing in lines.

In the prefd. method of treatment of the upper surface fibrous layer, the surfactant does not entirely penetrate the material but simply acts as a guide to any fluids so that they will penetrate the water-repellent material whilst limiting any flowback. 8.6.79 as 876865 (8pp519)

Alkyl aromates are oxidised in the liq. phase using O_2 at 180-250°C and an over-pressure of 5-40 bar, in the presence of 9-60 vol. % acetic anhydride (based on the starting material). Specifically acetates or methanolates of methyl substd. phenols are oxidised to acetates of hydroxybenzaldehydes or hydroxybenzyl alcohols, or methoxybenzaldehydes and methoxybenzylacetates, in the presence of an acid catalyst. The prod. is opt. hydrolysed with water at 200-240°C and an over-pressure of 20-50 bar in the presence of Na acetate.

Pref. oxidn. is effected in the presence of benzene or anisol, with a vol. ratio of acetate/methanolate : benzene of ≥1:1. High yields with good selectivity are achieved in a small number of process stages, by-prodn. of phenols is negligible. 28.1.74 as 001138 (6pp913).

q. cleaning compsn. (I) contains stabilised enzymes enab
ing (I) to be stored for extended periods without appre-
able deactivation of the enzymes. (I) comprises an aq.
oln. contg. 10-50 wt. % solids and has a pH 7-11.

(I) comprises by wt. (a) 2-25% ionic detergent builder
I); (b) 5-30 wt. % water-soluble surfactant (III); (c) 0.1-5
t. % water-soluble alkaline protease; (d) 5-40 wt. %
nzyme stabiliser (IV); and (e) the balance water.

(II) is water-soluble inorganic phosphate, nitrilotriace-
c acid, water soluble alkali metal salt of nitrilotriacetic
cid, ethylene diamine tetra acetic acid or its water solu-
le alkali water metals salt or the combination of alkali
etal carbonate and alkali metal metasilicate. (III) is
lkali metal alkyl sulphate (where alkyl has 10-18C atoms)
lkali metal alkylol sarcosinate (where alkylol gp. con-
ains 11-18C atoms), acetylenic glycol, alkyl aryl sul-
honate (where alkyl gp. contains 8-15C atoms) and/or
atty acid alkanolamide (where acyl radical has 10-18C
toms). (IV) is alkali metal sulphate or chloride, glycerol
r 2-8C alkylene glycol.

Compsn. can be stored at room temp. for extended
eriods without appreciable deactivation of the enzymes.

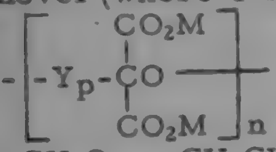
Keto di:carboxylate copolymers and salts - used as chelant, sequestrant and detergent builder non-depolymerising under normal domestic laundry conditions
MONSANTO CO 03.04.78-US-892591
A97 (A17 A26) (02.10.79) C08g-02/20

(A) Copolymer of ketodicarboxylates of formula (X) is novel
novel (where Y is comonomers selected from olefins and



$$-\left[-Y_p-\overset{CO_2M}{\underset{CO_2M}{C}}O-\right]_n$$

aldehydes of 1-3C, n is $\geqslant 2$ on av., pref. 10-200, esp. 10-100, p is $\geqslant 1$, M is selected from alkali metal, NH_4, 1-4C alkyl or 1-4C alkanolamine; pref. Y is $-CH_2O-$, $-CH_2CH_2-$ and $-(CH_3)CHCH_2-$).

(B) Copolymers of formula R_1-X-R_2 (where R_1 and R_2 are any chemically stable gps., (pref. oxygen contg) alkyl or oxygen contg. cycloalkyl) that stabilise the copolymer against rapid depolymerisation in alkaline soln.) and (C) Copolymer salt comprising an alkali metal, ammonium or alkanolamine saponified stabilised copolymer (B) are also claimed.

The copolymer is used as a chelant, sequestrant and detergent builder and does not depolymerise under normal domestic laundry conditions of 10-60°C, 15 mins. wash times and concn. of 250 ml/water. It will depolymerise in acid media, rendering the fragments more readily biodegradable in waste streams cf. prior art polymeric acetal carboxylates. 3.4.78 as 892591 (8pp966)

UNIL ★ D25 75266B/41 ★US 4169-957
Amide derivs. of carboxymethyl:oxy:succinic acid - useful as surfactants and prepd. e.g. from carboxymethyl:oxy:succinic anhydride
LEVER BROTHERS CO 04.04.78-US-893228 (16.05.77-US-797226)
E16 (E12) (02.10.79) C07c-103/32

A mixt. of amido ether polycarboxyl cpds. of formula $CH_2(COY)-CH(COY)-O-CH_2(COY)$ is new. In the formula, each Y is NH_2, $-NRR'$ or OM', with 1 or 2 Y substits. being NH_2 or $-NRR'$ and $\geqslant 1$ Y always being OM'. R is 6-22C alkyl or an alkylol gp. R_2 is OH (where R_2 contains 2-4C); R' is selected as R or is H; and M' is H, an alkali metal or ammonium.

The cpds. of the mixt. are useful as surfactants and may be prepd. starting from e.g. the carboxymethyloxysuccinic anhydrides claimed in US 4093634. 4.4.78 as 893228 Div ex 4093634 (7pp990)

CPI INDEXES

LERTING PATENTEE INDEX (II)

Veekly by section and overall, lists all current patents in atentee code order and, within a given patentee, in earliest riority date order. The first line gives patentee code, arliest priority date, patentee name, CPI classes and finally he current patent number. The second line gives the first art of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

1977

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnround at low prices. The schedule of prices and turnround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM NOVEMBER 1979.

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, $0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, $3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.30, $3.00 or Y820	—	Printed copies
JAPAN	4 days	per patent £0.95 or $2.20	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, $3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, $0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.25, $2.30 or Y770	11p, 20c or 70Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.65, $3.90 or Y1,000	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.17, $0.45 or Y110	Minimum charge equivalent to 5 pages	Photocopies
* Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. *				

METHOD OF ORDERING

(i) By books of standard order forms available upon request, or

(ii) By letter, or

(iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

(i) On receipt of bi-monthly invoices, or

(ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

PATENTS ON MICROFILM

For a number of countries, we film every patent specification in numerical sequence using a flat bed camera at 24:1 reduction ratio. The 200 ft. polyester diazo negative 16mm reels are second generation from a negative silver master. They are despatched weekly by airmail, shortly after the specifications are published.

A list of the available films is shown below, giving number of reels per country per year, annual costs as from 1st January 1980, and the dates from which film is available. Backlog film can be made available at the same annual costs as for the current year.

Please address orders and enquiries to the PATENTS SUPPLY DIVISION.

This sheet may be used as an order form for both current and backlog orders.

PATENTS ON MICROFILM—AVAILABILITY AND PRICES AS FROM JANUARY 1980

9/79

D1: FOOD; FERMENTATION

D11 : BAKING

FUSS/ ★ D11 77440B/43 ★DL-137-321

Turning mechanism for bakery prods., esp. glazed doughnuts - prevents ejection of tray and damage to goods

FUSSEL K 26.07.77-DL-205353

(29.08.79) A21c-09/04

The emptying of a tray laid out with doughnuts, iced or glazed (partly) on (one of) their surfaces, which are to be turned over, is effected by a mechanism including a shaft with arms, and a drive for the turning operation comprising an operating cylinder, a rack and a pinion which turns the tray through 180°. The tray with the doughnuts is locked by a train of levers, between a movable and a fixed jaw, before reaching the end of its rotation, so that the tray cannot fall. The goods are thus turned and when the end position is reached they fall under their own weight into the transport container. The tray may have baskets for holding prods. of different sizes, within limits. The sides of the tray have ''U''-flanges which can be slipped between the clamping jaws. A protective covering prevents wear of the rubbing surfaces.

Used for turning over bakery prods. in general, esp. glazed doughnuts, mechanically, and without the possibility of damage to the glazed or iced surface. 26.7.77 as 205353 (7pp1045)

RATI- D11 52201X/28 =DS 2621-836

Shearing and slitting a continuous band of crispbread - for continuous and automatic preparation of pieces for packaging

VEB FORSCH RATIONAL (WETZ/) 11.07.75-DL-187259

*(18.10.79) *DL-119-703 A21c-15/04*

A continuous band of crispbread, as wide as the full width of the oven, is fed at uniform speed to a transverse shear formed by upper and lower blades together with transmission elements. The crispbread strips are then transferred to a conveyor with rails and carriers on a roller chain conveyor and presented to pairs of circular knives forming a longitudinal cutting arrangement which delivers the crispbread segments.

Appts. is simple and the crispbread segments are produced with the min. of waste. Both cutting assemblies are remotely controlled according to signals from monitors so that the minimal load is imposed on the goods. 17.5.76 as 621836 (9pp1045)

TAKE ★ D11 78149B/43 ★J5 4119-038

Difficultly-digestible polysaccharide food for treating hyperlipidaemi - contains pectin, and can be added to bread, confectionery, biscuits and cookies

TAKEDA CHEMICAL IND KK 07.03.78-JA-026206

B04 (14.09.79) A21d-02/18 A23l-01 C08b-37/06

The food comprises granular particles of dia. 250 - 850 µ and moisture content ⩽ 10 wt.%, contg. 5 - 10 wt.% pectin as the difficultly digestible polysaccharide, to reducing cholesterol content in blood.

The compsn. consists of a vegetable extract gum (e.g. pectin, higher methoxy-pectin or lower methoxy-pectin), a pigment (e.g. beta-carotene, laccaic acid or caramel), a perfume agent (e.g. lemon essence, almond essence or sesame oil essence), a sweetening agent (e.g. cane sugar, D-fructose orreduced maltose jelly), an acid condiment (e.g. citric acid or malic acid), sodium chloride, sodium glutamate and nucleic acid condiment. 7.3.78 as 026206 (6pp15).

LENG= ★ D11 78558B/43 ★SU-606-569

Dough divider for bread prodn. - has multiple screws feeding dividing heads which operate synchronously with loading conveyor feeding moulds

LENGORSOVET BREAD 23.09.76-SU-408904

(28.04.78) A21c-09/08

Equipment for dividing dough and loading it into moulds to bake bread, comprises a feeder with screw delivery, rotating dividing heads with measuring chambers, and loading conveyor. Productivity is increased and more accurate dough dividing is guaranteed, to produce the dough portions, by fitting the feeder with extra screw delivery means, which are all positioned coaxial to the dividing heads. The number of measuring chambers equals the corresponding number of screw delivery means and number of moulds. The loading conveyor is positioned above the latter. The pitch at which the measuring chambers are distributed corresponds to the same distance apart of the moulds. The loading conveyor is also operated with a synchronously-moving carriage to raise the loading accuracy.

Lenkov, P.T., Vul, G.O., Iovnovich, L.S. et al. Bul. 18/15.5.78. 23.9.76. as 408904 (4pp29)

MOMI D11 50123A/28 =US 4171-197

Pastry rolling machine - with slower belt conveyor parallel to main conveyor downstream of wrapping roller

MORINAGA & CO 30.12.76-JA-160098

*(16.10.79) *DT2759-095 +A21c-03/06*

Prodn. of rolled sheet cookies is described using an endless conveyor adjacent to a support surface to deliver the material and an adjacent rolling-up roller moving at a slower speed. A deflector plate moves the material around the roll at the start of the rolling up process and a stop device alongside the roller prevents further material movement around the roller at a suitable stage.

The material is then transfered to a rolling up belt conveyor having a section parallel to, but spaced from the parallel support surface. The position and speed of the conveyor being such that the forming of the material into a roll continues during the transfer.

The arrangement provides a simple and rugged device for forming sheet material into rolls. 16.12.77 as 861298 (4pp397)

AGUI/ ★ D11 78948B/43 ★US 4171-198

Appts. for extruding pliant sheets, esp. dough - through slot in hopper with barrier reciprocating within slot

AGUIRRE A A 31.08.77-US-829292

(16.10.79) B29f-03/04

Appts. includes a hopper having an elongated slot along one of its side walls. A barrier having a thickness less than the width of the slot extends from outside the hopper through the slot into the hopper.

A rotor is positioned within the hopper and this moves the material within the hopper into compressive engagement with the portion of the barrier within the hopper. The barrier is reciprocated within the slot relative to the rotor so that as the rotor rotates the internal edge portion of the barrier remains close to the surface of the rotor but without touching it. The material compressed against the barrier is extruded through the slot as a thin continuous sheet.

The appts is used to extrude in particular, a masa dough used in tortilla prodn. Even fragile doughs can he extruded without damaging the material. 31.8.77 as 829292 (8pp295)

FORK/ ★ D11 79028B/43 ★US 4171-380

Cooked dough prod. contg. moist or frozen filling - with backing layer separating filling and dough shell

FORKNER J H 17.04.78-US-896711

(16.10.79) A21d-13/08 A23g-09/04

Food prods. comprise a moist filling contained in an envelope consisting of an external layer of cereal dough and a protective edible backing layer between the dough and the filling. The envelope has a seal formed by overlapping margins of dough, the backing layer being confined to the inner side of the dough and forming a thermal barrier.

The backing layer protects the dough from the moisture in the filling, and insulates the filling, so the dough is cooked quickly and thoroughly, while the filling can remain cool or even frozen. The seams of the prod. do not open on cooking, esp. on deep fat frying. 17.4.78 as 896711 (13pp955)

D12: MEAT; FISH PROCESSING

TEKH= ★ D12 77267B/43 ★DL -136-795

Filleting machine for fish of different sizes - removes bones completely without waste using spreader and tubular knives

TEKHRYBPROM 02.06.78-DL-205763

(01.08.79) A22c-25/16

The headless and gutted body of a fish is fed through guide flaps into a machine having an arrangement of circular knives and guide rollers behind the flaps for cutting away a strip of flesh from the underside of the belly. There are two mutually opposing filleting knives between the edges and the outer surfaces of which, a spreader is introduced.

Each knife is in the form of a ring and is supported on bearing rollers, with its cutting edge opposed to the line of motion of the fish. It presents to the side faces of the spreader a cylindrical concentric surface; the distance between the spreader side face and the cutting edge, corresponding near enough, to the greater thickness of the side bones of the fish.

Used for the prodn. of high quality fish fillets, whilst the bones removed are free from remnants of flesh. The machine removes the bones completely and handles fishes of different sizes. 2.6.78 as 205763(14pp1045)

PIEH/ ★ D12 77306B/43 ★DL -136-921

Compact steamer for preserving food esp. fish - has drying compartment enclosing steamer and a circulating conveyor system

PIEHL G 09.06.78-DL-205904

(08.08.79) A23b-04

A steaming plant for extracting water from foodstuffs consists of a steaming and drying chamber together with a circulating conveyor system. At least one chamber of one treatment zone encloses fairly completely, the chamber of other treatment zone. A simple insulating wall separates the two chambers, and is pierced for the conveyor at any suitable position.

The delivery and withdrawing stations of the circulating conveyor are placed immediately at the points, alongside or above each other, where the conveyors pass through the walls of the two chambers. The turning points of the conveyors are arranged vertically, one row above the other, with the rollers of the upper row offset at a definite angle to the vertical.

Used for preserving foodstuffs and esp. fish by steaming and drying. A more efficient plant is provide and in particular one which can be installed on board a factory ship. 9.6.78 as 205904(7pp1045)

Control system for hydraulic press for degreasing cocoa mass - regulates pump delivery according to load and stroke ratio
KEGEL W 19.06.78-DL-206099
(22.08.79) A23g-01/08

The fat is pressed out of a mass of cocoa in a hydraulic, multichamber press. The press piston is loaded for the transfer of the pressure to the material by a pump with a number of plungers. By means of these, when a predetermined pressure has been rached, the flow of hydraulic fluid is reduced automatically by the opening of the suction valves in the pump block.

The hydraulic pressure exerted by the pump and the amount of stroke of the press piston, or the weight of the cocoa butter pressed out, are converted into equivalent electrical values of the same kind. From them, a differential value is derived from which the behaviour of the mass of cocoa under pressure can be evaluated, and by which the delivery of the pump is regulated automatically.

System increases the output of multichamber presses and expels the maximal amount of butter from the mass without increasing energy requirements. At the same time the risk to the operative of being sprayed with hot grease is reduced. The system ensures the maximal speed of the press dependent upon the characteristics of the mass in the pressing. 19.6.78 as 206099(15pp1045)

Stable urea-molasses cattle food additive - with some of the urea complexed with fats or fatty acids and functional derivs.
BIROLAUD P 11.01.78-FR-000637
C03 (14.09.79) A23k-01/22

Prepn. of cattle food additive comprises mixing under pressure at room temp. 45-80% of urea, 5-25% of fatty acid or fat, glycidic acid solns. (5-35% dry matter, and 5-25% of water) to form in situ a fatty acid/urea complex in which the glycidic acid soln. remains inside to give a solid, pulverulent prod.

The ternary mixture is easy to manipulate and store, are clean to the touch and are not hygroscopic. Pref. fatty acids include oleic acid, butyric acid, etc. and in general, saturated or unsaturated 4-22C acids and their functional derivs. such as esters, amides and alcohols. Fats include animal or vegetable prods. such as suet, soya bean oil, arachis oil, etc. Glycidic acids include molasses from beet sugarcane, maize etc., wine washings, hydrolysates, etc. 11.1.78 as 000637 (9pp289)

MILE D13 15969A/09 =GB 1554-480
Prepn. of protein concentrate with fish texture - by extracting protein extrudate with aq. solvent at pH 4.4 to 4.8
MILES LABORATORIES INC 22.10.76-US-735002
*(D12) (24.10.79) *BE-859-999 A23j-03 + C07g-07*

A textured protein concentrate of meat-like texture and bland flavour is prepd. from protein extrudate contg. water soluble constituents. In the process, the water-soluble constituents are extracted from an extrudate of density 85-150 $g.l^{-1}$ on a dry wt. basis after drying to < 8% moisture, with an aq. solvent of pH 4.4-5.5 at 65°C.

Pref. the extraction is carried out at pH 5.4-5.5 to obtain a concentrate having the texture of tender lean portions of beef, pork- poultry or shellfish, or at pH 4.4-4.8 to obtain a concentrate having the texture of fish. The major portion of water-soluble constituents are extracted from the extrudate to provide a concentrate having ≥70 wt.% of protein.

The prods. are used to prepare hamburger-like meat patties, sausages, meatloaf, lean sirloin, chicken loaf, lean pork, tuna-fish cakes and shellfish cakes. 27.7.77. as 031656 (5pp931)

Fruit juice extn. by frusto conical disc - pressing against stationary surface with grid bar pulp separator (ZA 23.8.79)
BROWN INT CORP 17.10.77-US-842549
P28 +P71 (16.10.79) A23n-01 A47j-19/02 B30b-03/04 B30b-09/20

Appts comprises a pair of frustoconical discs which are rotated in synchronism but whose axes are mutually inclined. A stationary plate is sandwiched between the discs and creates a pair of paths along which fruit can be advanced. Whole fruit is introduced at a section of the appts. slightly upstream of the point of closest approach between the discs and plate. A knife is located at the upstream face of the plate to bisect the fruit.

The frusto-conical discs carry the fruit halves along divergen paths to a sepn station where grid bars separate the pulp from skin. Pref. this station is at the point where the disc is at its greatest spacing from the plate and a toothed roll is interposed so that its teeth extend between the grid bars.

The toothed roll and grid bar in the final section cuts pulp from the skin and thus remove the need to employ a high compression force which might have released undesirable peel oil. 17.10.77 as 842549 (13pp295)

Appts. for pressing and deaeration of curd cheese - with vacuum drawn in space between press plate and receptacle cover
KRAFT INC 27.03.78-US-890526
P13 (18.10.79) A01j-25/13
D/S: N(DT).

Curd is moulded into a cheese block in a rigid open-topp receptacle. The walls of the receptacle are cylindrical, the top being flanged to form an upper bearing surface. press plate is inserted into the open top of the receptacl on top of the curd mass. The press plate has an upturned peripheral flange forming a fluid reservoir on its upp surface. There is at least one orifice through the plate formed with upstanding side walls.

A rigid cover has a resilient material on its lower surface for engagement with the upper bearing surface o the receptacle. A vacuum may be drawn in the space between the cover and plate causing an air-tight seal betwee the receptacle and cover. Pressure is applied to force the press plate against the surface of the curd with residual whey being forced through the orifice to collect in the reservoir.

The appts. is used to press and deaerate curd pieces i a mould and to remove residual moisture from the curd prior to curing.

The curd is deaerated at the same time as it is being pressed.

D14: FOODSTUFF MACHINERY

SCHN/ ★ D14 77233B/43 ★BE -877-150
Rotary food mincer with trap for metal foreign bodies - which are centrifuged out of axial flow of prod.
SCHNELL K 22.06.78-DT-827369
P41 (15.10.79) A22c B02c

A machine for mincing chopping or similarly size-reducing a prod. partic a food prod., is of the type empolying a rotary cutting or pressing tool. To reach the tool, the prod has to be passed through axial holes in a centrifugal rotor keyed coaxially to the tool shaft. The rotor has an annular collecting channel surrounding the axial holes and designed to catch items flung outwards by the centrifugal rotor, specifically metal inclusions to be sepd. from the prod.

The collecting channel is pref. located on the circumference of the centrifugal rotor. The channel is pref. integral with the rotor eg. in the form of a channeled flange around the circumference of the rotor.

Used as a rotary mincer, chopper etc. for size-redn of food prods. partic meat.. Items of greater density than the prod. are centrifuged into the collector channel before they can reach the tool. This means that any nuts, bolts, meat-hooks, coins etc. which fall into the prod. are trapped before they can damage the rotating tool. 21.6.79 as 877150(10pp448).

Measurement of consistency of deformable substances such as foodstufs - by applying resistance force of substance against larger force of test body acting upon substance
ATHENSTADT D 07.06.78-DL-205844
A35 J04 R16 (08.08.79) G01n-33/02

In the non-destructive measurement of the consisting of pasty of plastic media, force compensation is effected by the counteraction of a force generated pneumatically, electrically etc.

A measuring element transmits the force quantity (x_b) proportional to the measured quantity (X_e) to a lever arm. The displacement releases in the tapping system a voltage signal which is fed after amplification in an amplifier to a compensation system so as to compensate (X_b). The compensation force reduces the displacement to a permanent control deviation.

Useful for testing bakery products, confectionery, fruit and vegetables, and also meat and milk products. 7.6.78 as 205844(7pp1142)

Predetermined, small, measured quantities can be delivered continuously from a large supply vessel into a measuring vessel by a pump consisting of a neck and a foot, the foot at least of which can be submerged in the fluid in the supply vessel.

The foot has a fluid capacity adjusted to the definite volume which has to be loaded into the measuring vessel. At the bottom of the foot there is an inlet which can be closed by a non-return valve. A feed close to the bottom opens into the measuring vessel, and the vol. of liq. in the foot can be loaded by pressurised gas through the pump neck.

A constantly accurate quantity, say of H_2O_2 for disinfecting plastic coated half and 1l milk containers can be nsured irrespective of the falling level of the liq. in the upply vessel, by having the pump neck smaller in dia. han the foot. 24.12.77 as 757897 (Add to 2708 422)(7pp)

Appts for canning or bottling food comprises a platform which can be supported in a water filled electric frying pan. The platform has a removable cover in which the containers to be heat treated are placed.

The legs supporting the platform are hollow and allow steam and condensed steam to circulate between the water and the chamber. Additional holes are provided in the platform to give additional circulation.

The arrangement is simple and compact. 10.8.78 as 932886 Reissue of 3973480 (13.5.74 - US - 469544) (4pp)

D15: WATER TREATMENT

MESG ★ D15 77237B/43 ★BE-877-162

Treating water for drinking using ozone and oxygen - with mixing effected in a water jet gas compressor

MESSER GRIESHEIM GMBH 21.06.78-DT-827151

(15.10.79) C02b C02c

In the prepn. of drinking water or the purificn of used water, in which undesirable materials are oxidised, to assist their sepn. by flocculation, at least a partial current of the water to be treated is passed under pressure into a column packed with filling material in contact with an ozone/oxygen mixt. from an azone produces. The ozone and a part of the oxygendissuling in the water and the undissolved oxygen are recycled to the ozone producer and the water contg. oxygen and ozone is eracuated from the column.

Improvement is that the water to feed the column is derived from a partial current which is passed into a water jet gas compressor in which the oxygen/ozone mixture is compressed and mixed with the partial current; the resulting mixt is then fed to the packed column.

Compression is much less costly than a water ring compressor, also friction in compression is avoided and further a small column may be used. 21.6.79 as 877162(7pp)

Purification of waste water using single sludge system - in vertically partitioned single reactor contg. fluidised non-biodegradable solids

BESIK F 01.04.77-CA-275345

(09.10.79) C02c-01/06

Waste waters contg. carbonaceous materials, nitrogenous materials, phosphorus and suspended solids are purified in a single tank having three reaction zones. Processes effected in the zone include adsorption of dissolved organic matter by fluidised suspended particles, bio-oxidation of biodegradable organic matter, ammonification and chemical pptn. of phosphorus. Pref. there is a fourth zone in which toxic residues are chemically oxidised. There is continuous separation of the fluidised bed solids fromthe purified waste water and recirculation of the solids between the three reaction zones.

The purification process is not affected by shock hydraulic and organic loadings and produces min. excess sludge Appts. to effect the purification requires little space and essentially no maintenance. 1.4.77 as 275345 (28pp1044)

BESI/ ★ D15 77265B/43 ★CA 1064-170

Small/scale sewage treatment in self-contained tank - contg. aeration chambers, multichannel solids separator, flow rate equaliser and charcoal contg. chamber

BESIK F 16.05.78-CA-303462

(09.10.79) C02c-01/06

Appts. comprises a closed waste water storage-reaction tank including $\geqslant 3$ aeration chambers separated by common vertical partitions. Air diffusers are located in the sidewall of the chambers to induce circulation. Restricted openings in the partitions permit flow of aerated liquor from chamber to chamber and flow of sludge solids from the third to the first chambers.

A submerged multichannel suspended solids separator is located in the third chamber to separate out the purified liq. and sludge. A flow rate equaliser controls the sewage flow through the chambers and the treated water flow through the separator.

It is used for small scale domestic and marine sanitation systems. Chemicals are stored and proportioned in accordance with the unsteady and batchwise flow of the incoming raw sewage. Suspended solids are separated inside the reactor thus eliminating a separate clarifier. The chemicals require annula replenishment and excess sludge is withdrawn once or twice per year. The appts. is reliable and can operate unattended. It is not affected by pitching and rolling. 16.5.78 as 303462 (18pp1044)

Removal of nitrate(s) nitrite(s) and organic cpds. from waste water by activated sludge treatment with added ammonia or urea

GUBERNATOROVA V A 05.06.78-DL-205795

E36 (15.08.79) C02c-01/06 C02c-05/10

Waste water purificn. to remove nitrates and/or nitrites and organic cpds. is carried out by activated sludge treatment in the presence of added NH_4^+ ions and/or urea at a dissolved O_2 concn. of 0.1-4.0 mg/l.

The treatment can be effected at pH4-12. The amt. of NH_4^+ and/or urea added is pref. 10-1000 mg/l. A biogenic P cpd. can also be added, pref. superphosphate or Na_3PO in an amt. of $\leqslant$ 200 mg/l.

High purificn. levels can be achieved over a wide pH range (e.g. 95-98% redn. in BOD, 99% NO_3^- removal and 98-100% NH_3 removal). 5.6.78 as 205795(14pp367)

GART/ ★ D15 77404B/43 ★DL-137-18

Separator for fluids from animal and human sewage - has double vessel using capillary action to extract fluid

GARTNER F 16.06.78-DL-206035

(22.08.79) B01d-43 C02c-01/26

A separating system requiring very little energy is used for partially abstracting the fluid phase from animal and human sewage, activated sludge, etc., and employs the familiar capillary effect. The plant consists of a conical funnel, a lifting worm, a tangential inlet for the suspensio and a container encloding the funnel, for collecting the fluid phase. The inner, upper, edge zone of the funnel is layered with capillary material which extends as a collar beyond the brim of the funnel. The layering is covered wit a mantle in the form of a truncated cone.

A cylindrical container for collecting the fluid phase encloses the funnel, in which there is, along its mantle, a conveyor worm for extracting the denser phase, and this includes a clearer for cloating matter. The increase the throughput of the plant, a vacuum line is connected to the container. At the funnel outlet, the end of the worm pivots as the upper section brushes the entire surface of the funnel.

To remove the fluid phaseform sewage in the most economical manner, so that, with the minimal expenditure of energy an effluent can be produced which can be put into the public drains. The plant is applicable where large amounts of dung are produced without the possibility of its use in agriculture, whilst legal requirements regarding enviromental pollution are observed. The installation dispenses with a high mechanical outley and the elimination of band pressure and filters eliminates breakdowns. 16.6.78 as 206035(8pp1045)

WASS- ★ D15 77414B/43 ★DL-137-219

Aerator for sewage sludge container - has worm in tube with conical upper end circulating fluid and air

VEB WASSERVERSORG A 16.06.78-DL-206040

(22.08.79) C02b-01/28 C02b-09 C02c-01/10

A vertical tube enclosing a worm shaft from which the worm projects below, and which has a funnel at its upper end, is supported in the centre of a tank. The upper edge of the funnel is at or is slightly below the level of the liquid, such as sewage or sludge, in the tank, When the driving motor rotates the worm, liquid and air are drawn into the top of the funnel and are expelled from below, so that aeration takes place.

Used to introduce the necessary amount of oxygen into the sewage with the minimal expense. At the same time, foam is destroyed without ancillary equipment being necessary. 16.6.78 as 206040(8pp1045)

Automatic piston valve for an ion exchange water- - softening plant

FLECKENSTEIN A J (FLE /) 01.10.68-US-764178

*Q66 (18.10.79) *DT1949-640 C02b-01/40 F16k-31 04*

In the plunger housing bore of a motor operated valve for a water purifier, four equally spaced annular grooves form the flow channels joining connectors for the outlet, e inlet, the tank feed and the drain; the outlet being be-een the inlet and the tank feed which connects to the sof-ener via a tube.

The piston has an axial flow channel extending its full ength, and has sealing ribs spaced out so as to form grooves between them. The distance between the middle rib nd the bottom rib is greater than the distance between djacent sealing rings and greater than the distance between the centre lines of adjacent flow grooves. It is smaller than the distance between three adjacent sealing rings. The groove between the middle rib and the top rib is somewhat larger than the axial width of a sealing ring.

By reducing the axial flow passages from five to four, much smaller valve with a shorter piston stroke is possible, and a particular advantage is that the valve can thus be operated continuously in a programme.

A timer acts through a motor to turn the piston disc periodically so that the piston reciprocates. 1.10.69 as 949640 (17pp1045)

Desalination of sea water by evapn. - with preheater in tube inside brine tank of each stage to reduce dimensions
SNAMPROGETTI SPA 06.06.75-IT-024079
*(18.10.79) *BE-842-201 C02b-01/06*

Instead of two film vapourisers in each cylindrical section of a vertical, multi-effect, desalination column, there is only one. This has a pipe plate which is circular in cross-section and instead of two containers there is only one of these also. The plant for carrying out the process has heat exchangers, separating containers, feed lines for the sea water and primary steam, drains for brine and pure water, and connections to vacuum. The exchanger for preheating the sea water is enclosed in a pipe extending through the section. It is positioned in the container holding the salt solution, and divides this into two parts hydraulically sealed off from each other. Esp. in plants for smaller and medium output, the enclosure of the preheater in a tube has advantages. By having a single vapouriser for each section the column and esp. the brine container can be reduced in dimensions, whilst the plant is cheapened. 4.6.76 as 625358 (3pp1045)

C08l-05/18 C08l-09/28 C08l-33/20 H01m-02/16 H01m-10/14

Dried porous membranes consist of polyacrylonitrile walls, separating largely interconnected small pores, and surface layers, pref. 0.1-20 μm thick, linked together by a carrier layer to form a single, closed polyacrylonitrile phase. The surface layers contain pores of size 0.001-0.05 μm. The carrier layer contains pores with a dia. larger than that of the pores of the surface layers. The membrane has a porosity of 20-70 vol.% and a fragility of <30, as defined in the patent.

The membrane is pref. produced by extruding a polyacrylonitrile soln. through a fishtail nozzle into a coagulating bath and immersing the wet film under condition of shrinkage and stretching (using a frame) into hot water or a mixt. of water and a non-solvent at 70-120°C. The membrane is then dried <85°C. Equations for the immersion conditions are given in the patent.

Membranes have better flexibility, folding and buckling strength as well as tensile strength than known membranes. They are esp. suitable as separators between alternating +ve and -ve plates of lead batteries. They effectively prevent the movement of Sb and Pb particles within the battery and are resistant to oxidation so that the life of the batteries is prolonged. 7.9.77 as 740252 (18pp260)

In a desalination plant for sea water, the evaporation chamber is arranged between the cooling chamber and the heating chamber. The two latter are connected via an air duct for recycling the cool air. The evapn. chamber is closed by a cover foil on the side towards the solar radiation.

This compact arrangement allows the plant to be mounted in a container for easy transportation. The fresh water prodn. capacity and the efficiency of the plant are improved. 14.4.78 as 816233 (12pp39)

MORT/ ★ D15 77596B/43 ★DT 2816-491

Sludge cleared from swage tank floor by towed rakes - converging to mouth of suction pump with flexible delivery hose

MORTL K 15.04.78-DT-816491

(18.10.79) B01d-21/18

Sludge clearing appts. intended esp. for removing sludge which has settled on the bottom of a clarification tank, sludge tank, pond or the like, and comprises a pair of rakes or scrapers, converging towards each other to meet at a point and pulled by a cable with the open mouth forwards; thus, as the V-shaped assembly is pulled forwards, sludge collects at the apex of the convergence; from this point it is removed through a flexible hose, more specifically in combination with a conveying screw or a suction pump; in the latter case; the flexible hose forms the delivery line fro the suction pump.

Settling tanks, sludge tanks, etc. can be easily clea ed of continually accumulating sludge without expensive heavy plant. 15.4.78 as 816491 (10pp236)

Ammonia and ammonium salt removal from waste water - countercurrent distn. with steam or air and carbon dioxi expulsion before alkali addn. (NL 12.10.79)

HOOGOVENS IJMUIDEN BV 10.04.78-NL-003765

C04 H09 (18.10.79) C02c-05/02

Removal of NH_3 and ammonium salts from industrial was waters, comprises passing the waste waters through >1 distn. column in countercurrent to steam or pre-heated a and admixing the waste waters with alkali in an intermediate step to convert the NH_4^+-ions to NH_3.

The novelty comprises charging the column(s) throug which the waste water flows before alkali addn. with fres steam or pre-heated air which is different from the stea or air in the column(s) through which the waste water flo after alkali addn. The distn. process before alkali addn. is carried out so that all dissolved carbonic acid is expel ed as CO_2 from waste water.

The process is used esp. for treating waste waters from a coking plant. NH_3 can be recovered and converte to $(NH_4)_2SO_4$ used as fertiliser. Scale formation is preve ted and alkali quantity required is reduced. CO_2 removal allows the use of $Ca(OH)_2$ as alkali without risk of formin $CaCO_3$. 6.4.79 as 914004 (12pp200)

Polymerisation of water-soluble monomers e.g. acrylamide - using 2,2'-azo-bis-n,n'-di:methylene-isobutyl amidine as initiator
WAKO PURE CHEM IND KK 08.04.78-JA-041568
A60 E16 (A14) (24.10.79) C08f-04/04 C08f-20/54

A water-soluble polymer is prepd. by polymerising a water-soluble monomer using as initiator 2,2'-azo- bis-(N,N'-dimethylene-isobutyl-amidine) (I) or its acid addn. salt and opt. another azo cpd.

The polymer may be useful as a flocculating or fibre treating agent, paper strength booster or adhesive. The polymer has a high mol.wt., a low amt. of branching and good water solubility. Problems encountered with redox initiators, e.g. crosslinking and induced reducing agent decomposition, are avoided. 6.4.79. as012230 (7pp558)

ASAG ★ D15 77797B/43 ★GB 2018-786
Macromolecular adsorbent for heavy metal ion recovery comprising a polymer having pendant gps. contg. fluorine and phosphorus
ASAHI GLASS KK 12.04.78-JA-042150
A97 K05 M25 (24.10.79) C08f-08/40

A macromolecular adsorbent is a polymer having pendant gps. of the formula $-(R^1)_p-(R^2)_q-R_f-(R^3)_r-(O)_l-P(O)X^1X^2$, where R^1 is a 1-8C divalent organic gp.; R^2 and R^3 are 1-5C divalent organic gps.; p, q, r and l are 0 or 1; Rf is a 1-10C divalent perfluoro gp.; and X^1 and X^2 are hydroxyl or a gp. or atom convertible to it.

The adsorbent is suitable for recovering heavy metal (e.g. U) ions from a dil. soln. such as sea water. It has high abrasion resistance, stable adsorbing capacity, high ion-exchange activity, highadsorbing velocity and low susceptibility to damage.

The polymer may be prepd. by polymerising a monomer having perfluoro and phosphono gps. or by a macromolecular reaction in which the perfluoro and phosphono gps. are introduced into a skeleton polymer, e.g. of the polystyrene type. The polymer pref. has a phosphono gp. content of >0.2, esp. >0.4, mequiv./g. dried H type adsorbent; and there are pref. $\geqslant 2$F atoms per phosphono gp. The average mol.wt. is generally $>20,000$. 12.4.79. aa 013123 (9pp558)

Regenerating ion exchange resin in column - by upwardly passing regenerating liq. and pouring water over upper part of resin bed to prevent resin movement

NIPPON WATER TREATM KK 03.03.78-JA-024309

J01 (12.09.79) B01j-01/09

Method comprises flowing a regenerating liq. upward through a resin bed formed in the column. The object is to effectively regenerate the resin without disturbing or floating up the resin, and to reduce the water consumption. In the novel method, the regenerating liquid is fed into the column $\geqslant$2 times upon regeneration, while water is poured over the upper portion of the resin bed to suppress upward motion of the resin (due to upward flow of the liquid and the liquid and water are connected into a collecting pipe opened in an upper portion of the bed and drained outside. Just before passing the liquid into the bed, water is poured over it to close pores of the bed with water films. 3.3.78 as 024309 (5pp26).

KURS ★ D15 77893B/43 ★ J5 4117-380

Polyvinyl alcohol based selectively permeable membrane - modified by presence of acetal gps. and crosslinking

KURARAY KK 06.03.78-JA-025722

A88 J01 (A14) (12.09.79) B01d-13/04 C08j-05/18

PVA system selectively permeable membrane high in its mechanical property, has >30 mole % acetal content and acetal cross-linked extent of > 30 minutes in dissolution of the membrane in 65% HNO_3.

The membrane is obtd. by mixing 50 - 150 wt.% of polyalkylene glycol of 600 - 3,000 average mol.wt. with a PVA system polymer in a critical mixed rate of 0.80 - 1.00 to obtain a PVA system polymer composite, coagulating the composite in a liq. phase to obtain a coagulate cpd., and acetal-reacting the coagulated cpd. with 10 - 300 g/l of a monoaldehyde cpd. and 0.1 - 100 g/l of a dialdehyde cpd..

In an example, 9% boric acid and 95% polyethylene glycol (PEG) were mixed with 100% of PVA at 100°C to obtain an aq. soln. of 16% of PVA. The aq. soln. was coagulated in a coagulating soln. of NaOH and Na_2SO_4 to obtain a hollow fibre. The fibre was acetal-react d in a soln. of formaldehyde, H_2SO_4, and Na_2SO_4, washed with water, and dried to obtain the selectively permeable fibre membrane. 6.3.78 as 025722 (7pp51).

KURS ★ D15 77894B/43 ★ J5 4117-38

Fitting bundle of hollow fibres to appts. for purificn. of water includes inserting into open ended cylindrical body which protect fibres

KURARAY KK 13.03.78-JA-028369

A88 P34 (12.09.79) A61m-01/03 B01d-13

A bundle of hollow fibres are fitted to an appts. for the prodn. of fresh water from sea water or for the purificn. of waste water. The bundle of hollow fibres is inserted into a cylindrical body which is open at at least one end, and one end of the body in the side of the free end of the bundle is bent to the other end of the body, to obtain a hollow fibre bundle protected by the body. The protected bundle is introduced into the core of the appts. and only the body is removed from the core to fit the bundle of hollow fibres.

The hollow fibres are made of cellulose, cellulose derivatives, polyvinyl alcohol, polyacrylonitrile, polymethylmethacrylate, polyamide, or polyolefin. The outer diameter of the hollow fibre is 10 - 3,000u, and the wall thickness is 500u. 13.3.78 as 028369 (4pp51).

TELN- ★ D15 77897B/43 ★ J5 4117-38

Alkali resistant agent for removing heavy metal from waste water obtd. by addn.-condensing alkali treated coal with aldehyde presence of alkali, kneading, pelletising and heating

TELNITE KK 03.03.78-JA-024222

A91 J01 (12.09.79) B01d-15 C02c-05/02

The agent is obtd. by addition-condensing alkali treated coal or weathered coal containing humic acid with aldehydes, such as, acetoaldehyde, paraformaldehyde, or formalin, in the presence of alkali, kneading the resulting condensate, pelletising, and heating to complete the condense.

In an example, 30 pts. of 37% formalin was gradually added to 100 pts. of lignite treated with alkali while stirring in the presence of alkali at 90°C for 30 minutes to obtain an addn. condensate. The condensate was kneaded and shaped into pellets. The pellets were heated at 150°C for 1 hour, and treated with 1N HCl to obtain a H type ion exchange resin. The resin was treated with 1N Ca acetate to obtain a Ca type ion exchange resin used as a salt type heavy metal catching agent. 3.3.78 as 024222 (4pp51).

Decolourisation of dye contg. waste liquor - by adding formaldehyde and urea and/or melamine to give condensed prod.

TAOKA CHEMICAL KK 06.03.78-JA-025804

A97 E24 (A21) (14.09.79) B01d-21/ C02c-05/02*

A coloured waste liquor contg. azo-, phthalocyanine-, xanthene- and azine- dyes, discharged from dyes-producing plant, is easily and effectively decolourised by adding formaldehyde, and urea and/or melamine under neutral or acidic state, followed by stirring for a few mins. to a few hrs. until decolourisation is completed. The decolourised liquor is then if necessary neutralised with $Ca(OH)_2$ or NaOH, followed by filtration and discharge, but its filtratability is very excellentdue to very small amt. of sludge resulted.

The decolourising mechanism is thought to be as follows. The dyes are put into three-dimensional lattice structure resulting from reaction between formaldehyde and urea and/or melamine; the dyes are deposited by adsorption coagulation or initial condensed formaldehyde-urea (and/or melamine) resin; or due to lake extn. effect by urea and melamine etc.. 6.3.78 as 025804 (3pp34).

SEKI ★ D15 78115B/43 ★J5 4118-656

Treatment of starch-contg. waste water - by coagulation using added polysaccharide extracted from plant seed, and opt. other coagulants

SEKISUI CHEMI IND KK 06.03.78-JA-025871

C04 (D13 D17) (14.09.79) B01d-21/ C02c-05/02*

A floated starch-containing waste water, e.g. discharged from mill, starch-producing factory, brewery and food-processing factory etc., is subjected to coagulation to remove therefrom the floated starch under high settling rate and therefore to obtain clarified water having excellent transparency by adding thereto polysaccharide collected from plant seed, e.g. guar gum, rocast bean gum, quins seed gum and tara gum etc. or collected from plant resin, e.g. arabinogalactan gum, acacia, tragacanth gum and calaya gum etc. or its deriv., e.g. carboxymethylated deriv. if necessary in combination with alum, e.g. potassium alum and ammonium alum etc. and assisting coagulant, e.g. fossilised shell, $Ca(OH)_2$, $CaCl_2$ etc. under pH of 7 - 8.

The coagulated starch-containing matter separated is available for use as fodder and fertiliser etc. due to its high starch content and excellent stability against domestic animals and plants. 6.3.78 as 025871 (5pp34).

KINZ- ★ D15 78174B/43 ★J5 4119-314

Titanic acid adsorbent for recovering uranium in sea water - prepd. using stainless steel appts. and in presence of added iron ions

KINZOKU KOGYO JIGYO 09.03.78-JA-026026

E31 K05 M25 (17.09.79) B01d-15 C22b-60/02

Iron ions are added to an aq. soln. of titanium sulphate or titanium tetrachloride in an amt. of 5 - 30 mol.% of the titanium. Then, the aq. soln. is heated and hydrolysed in a stainless steel container, thereby, producing a titanic acid adsorbent.

The quantity of uranium adsorbed by the titanic acid adsorbent is much higher than that adsorbed by conventional titanic adsorbent produced in a container made of glass.

In an example, 1.2 l titanium sulphate (Ti: 82 g/l, H_2SO_4: 500 g/l) is put in a stainless steel(SUS 40) container. The titanium sulphate is stirred by a stirrer made of the same stainless steel for 1 hour. 0.877 l of aq. ammonia (252 g/l) is added, then the soln. is boiled for 30 minutes. The solution is cooled in the atmosphere and solid substance obtd. is washed with water, then dried at 70°C to give the titanic adsorbent. 9.3.78 as 026026 (3pp7).

TOKU ★ D15 78209B/43 ★J5 4119-374

Desalination using multistage electric dialysers - which contain cationic and anionic exchange membranes

TOKUYAMA SODA KK 10.03.78-JA-026501

(17.09.79) B01d-13/02 C02b-01/82

Water contg. electrolytes, e.g. sea water or boiler water, is passed into the desalinating room and concentrating room of a first electric dialyser provided with a cationic exchange membrane and an anionic exchange membrane, then the desalinated water from the desalinating room of the first stage is passed into the concentrating room and desalinating room of a second stage dialyser with the same ion exchange membranes, then the desalinated water from the desalinating room of the second stage is passed into the concentrating room and desalinating room of a third stage, while the conc. water from the concentrating room of the second stage is recycled to the concentrating room of the first stage, and then the desalinated water from the desalinating room of the third stage is passed into both rooms of an n-stage dialyser, while the conc. water from the concentrating room of the third room is likewise recycled to the concentrating room of the second stage, in which the same operation is repeated and lastly desalinated water of a predetermined quality is obtd. from the n-stage.

Method is capable of rapidly and effectively desalinating various concentrations of saline water without lowering the current efficiency and also of giving highly desalinated water. 10.3.78 as 026501 (5pp17).

KINZ- ★ D15 78230B/43 ★J5 4119-399

Recovering desorbent from desorbed-uranium contg. liquor - the desorbent being e.g. sodium (bi)carbonate, bi subjecting to electrodialysis

KINZOKU KOGYO JIGYO 09.03.78-JA-026025

E31 K05 M25 (17.09.79) C01g-43 C21b-01

Desorbing agent is recovered from desorbed U-contg. liquor resulting from passing sea-water through U adsorbant, e.g. titanate-bearing adsorbent etc. and subsequently desorbing the adsorbed uranium with aq. soln. the desorbent.

The improvement comprises using as the desorbent aq. soln. of alkali metal carbonate, e.g. Na_2CO_3 or $NaHCO_3$ etc., and subjecting the desorbed U-contg. liquor to electrodialysis treatment using combination of anion exchange membrane capable of passing only monovalent ion and cation exchange membrane, so that the alkali metal carbonate is only taken-out to the outside of the system.

It is possible to use non-volatile alkali metal carbonate as the desorbent for uranium, thereby environmental contamination of sea, is prevented. 9.3.78 as 026025 (4pp34).

HITK ★ D15 78397B/43 ★J5 4120-

Recovering iron components from acid pickling waste - by treat with modified waste sodium hydroxide contg. silicic acid resulti from removing sand from castings

HITACHI METAL KK 13.03.78-JA-028498

E37 M12 (M22) (18.09.79) C01g-49/08 C02c-05/02 C21b-15

The waste NaOH including silicic acid content is dissolved in water for precipitating and removing the sand particles. It is added with $Ca(OH)_2$ or CaO to give $Ca:SiO_2$ mol ratio >3 while the aq. soln. is heated to above 60°C to precipitate and separate the silicic acid content

The decanted material is ultrafiltered to separate colloid and the filtrate is added to the waste acid to convert Fe^{2+} to Fe hydroxide. This is oxidised to give Fe^{2+} Fe^{3+} = 1 : 2 and Fe content in the waste acid is precipitated or flocculenced as Fe_3O_4.

Waste NaOH and waste acid can be treated simultaneously. 13.3.78 as 028498 (4pp53).

HITK ★ D15 78423B/43 ★J5 4120-2

Neutralisation of pickling waste acid - using waste mud produc when caustic soda is regenerated by removing silicate component

HITACHI METAL KK 13.03.78-JA-028497

E37 M12 (M22) (18.09.79) C02c-05/02

Waste caustic soda contg. silicate component is firstly dissolved in water to sedimentate and remove its sand particle component, then $Ca(OH)_2$ or CaO is added to the soln. so that the molar ratio of Ca/SiO_2 becomes $\geqslant 3$. Then the resulting aq. soln. is heated at $\geqslant 60$°C and the silicate component is pptd. and sepd. as $CaO.SiO_2$, whic is then mixed with the pickling waste acid.

The pickling waste acid can be neutralised by using a waste mud which is produced when caustic soda is regenerated by removing silicate component from so called "waste caustic soda" (which is obtained from the proces for removing the sand from cast products). The process prevents environmental pollution. 13.3.78 as 028497 (3pp55).

HITF ★ D15 78424B/43 ★J5 4120-2

Treatment of garbage-contg. dirty water - by sepg. into liq. a solid, adding e.g. calcium hydroxide to the liq., drying adding the solid and burning

HITACHI SHIPBLD ENGG KK 13.03.78-JA-028856

(18.09.79) B01j-01 C02c-03

The garbage-contg. dirty water is separated into liq. and solid, and a material of low solubility with low speci ic gravity (such as calcium hydroxide, calcium carbonate, magnesium carbonate, etc.) is added to the separated dirty water then the resulted mixture is condensed or dried, then the obtained condensed residue or dried cake is burned with separated solid garbage

The garbage contg. dirty water cannot be directly condensed in order to be burned, because inorganic and organic substances are dissolved in the dirty water and the organic substances (esp.) are pyrolysed or polymerised to produce sticky tar-like products, which adhere to the burning appts. when they are condensed. In this process, the tar-like products produced by the condensation of the dirty water can be effectively decomposed. 13.3.78 as 028856 (2pp55).

Liquid aerator for effluent - has vertical shaft driving vaned disc via spider and springs, for smooth starting and stopping

PUBLIC BUILD TOWN P 03.11.77-SU-539067

(08.02.79) C02c-01/10

An aerator, comprises a vertical drive shaft carrying a vaned disc. To increase operating life, by reducing torque on the shaft, the disc is mounted freely on the shaft and on its upper end surface has stops with springs. The shaft has a spider, with each rib located between stops and connected with the free ends of the springs

When starting, the drive torque on the shaft is transmitted to the disc via the spider, springs and stops, the resistance of the working medium causing the springs to be compressed and absorb part of the energy, the spring then gradually decompressing. The springs similarly absorb part of the energy when stopping. Such arrangement provides smooth load transmission.

Combustion decontamination of aq. waste - involves separating water into soluble material and solid particle contg. streams

IVANOVO POWER INST 09.09.77-SU-523553

J09 Q73 (05.02.79) F23g-07/04

The fire decontamination method for aq. waste can be used in chemical and petrochemical industries. The water is decontaminated by flame treatment in turbulent combustion products of the waste water. In order to ensure continuous reliable waste water decontamination, which contains soluble matter and solid particles, the waste water is separated into two streams: the stream with soluble matter and a stream with solid particles. Bubbles are passed through the second stream, and the droplets carried out are supplied to the turbulant combustion product stream, formed by the first stream treatment.

Compact electrolytic appts. for chlorine generation - with forced coolant flow around transformer housing and semiconductor power rectifier

THEMY T 03.11.78-US-957566

E36 J03 (16.10.79) C02b-01/82 C25b-09 C25b-15/08

A chlorine generator includes a power transformer surrounded by a housing in thermal contact. A heat conductive metal frame is thermally connected to the housing and also to a metal block with a cavity in which a semi-conductor power rectifier is held.

An aq.coolant is passed through a conduit which passes through the frame adjacent to the housing. This cools both the transformer and rectifier. The output of the rectifier is connected to an anode and cathode of a Cl_2 generating electrolytic cell. The coolant is directed into the cell where it serves as the electrolyte. Overflow collant with increased Cl_2 level is directed to a reservoir.

The appts. is used to generate Cl_2 (and usually ozone) for sterilisation of a body of water such as a swimming pool. It is relatively compact and eliminates the conventional large cooling fins. 3.11.78 as 957566 (4pp295)

Oxygenation of large body of sewage - by introducing sewage previously supersaturated with oxygen in small pressure vessel

FMC CORP 08.08.77-US-822594 (28.08.74-US-501423)

(16.10.79) C02b-01/34 C02c-01/06

The dissolved gas concn of a liq is increased by dissolving a gas in a first body of the liq under a pressure of at least several atmospheres. The pressure is decreased to atmospheric while impartting a min of turbulence to the liq. The depressurisation is accomplished without the liq. flowing along a path which has a sharp pressure drop. The first body of liquid is gently transferred into a much larger second body of the liq. at atmospheric pressure.

The method is particularly used in an activated sludge sewage treatment plant for increasing the O_2 content in a mixed liquor tank. The pressure vessel required is much smaller than in conventional installations. 8.8.77 as 822594 (+29.5.76 - US - 671659) (14pp295)

Hydrolysis of polyacrylamide dispersed in polymeric latex - as water-in-oil emulsion, using alkali-stable surfactant then alkali
NALCO CHEMICAL CO 02.10.78-US-947905 (15.10.74-US-514961)
A14 H01 (A25) (16.10.79) C08l-33/26

Polyacrylamide is hydrolysed by forming a polymeric latex comprising a water-in-oil emulsion. The emulsion comprises 20-50 wt% water, 10-40 wt% oil, 20-40 wt% finely divided polyacrylamide dispersed therin and 0.1-15 wt% of an alkali stable organic surfactant pref. ethoxylated fatty ether. The latex is reacted with an alkali metal hydroxide or quat. ammonium hydroxide to form a stable water-in-oil emulsion of finely divided hydrolysed polyacrylamide. It is pref. hydrolysed to 30-50 wt%.

It is used for thickneing and flocculation, e.g. dewatering of industrial and sewage wastes and clarification of turbid aq. solns. or sec. and tert. oil recovery processes. The emulsion dissolves in water much faster than hydrolysed polyacrylamide powder. 2.10.78 as 947905 (15.7.76 7.10.77, 5.6.78 - US - 705652, 840446, 912652) (5pp1302)

OCCI ★ D15 79011B/43 ★US 4171-342
Recovery of calcium fluoride from pond waters - by two stage treatment with calcium carbonate or oxide to ppte. solids
OCCIDENTAL CHEM CO 22.12.77-US-863085 (03.04.74-US-457565)
C04 E33 (E36) (16.10.79) C01f-11/22

Calcium fluoride is recovered from pond waters, contg. 0.1-5% F, 0.1-2.5% SiO_2 and 0.1-5% P_2O_5, 0.1-0.5% Ca in soln. and 0.1-0.5% soluble sulphate salts, and soluble metallic cpds. e.g. Fe, Al and Mg cpds. First, $CaCO_3$ is added with agitation so that 0.3-0.8 equiv. of Ca is added per equiv. of F, and soluble Ca salts are formed. Then additional $CaCO_3$ is added to 0.1-2 equivs. Ca per equiv. F, so that the total Ca equiv. added in the two steps is 1-2. The solids formed (contg. >85% of the initial F as CaF_2, together with Ca phosphate, SiO_2, Fe, Al and Mg) are sepd. and the CaF_2 is purified. The $CaCO_3$ may be replaced wholly or partly by CaO.

The pond waters result from the prodn. of wet-process H_3PO_4, and other processing waste waters can be treated similarly. The treated waters are suitable for recycling or for discharge into streams, etc. 22.12.77 as 863085 (+11.10.77, 3.1.77- US - 840533, 756009) (12pp1248)

Accelerated chemical reaction at increased pressure - in subterranean well with feed liquid proving hydrostatic pressure
MCGREW J L 17.03.78-US-887506
(18.10.79) C02b-03/08
D/S: N(BR, DK, JA, SU) + E(CH, DT, FR, GB, SW).

A chemical reaction between at least two reactants is carried out in a subterranean well. Inlet and outlet conduits lead to a reaction zone at the bottom of the well and hydrostatic pressure in the conduits provides a preselected pressure in the reaction zone.

The temperature of the feed is controlled to regulate the temperature in the reaction zone. Additionally hot liquid from the reaction zone heats feed liquid by a heat exchange action between the inlet and outlet conduits within the well. The temperature is maintained at a value which prevents boiling in the reaction chamber.

The appts. accomplishes wet oxidation of sewage sludge wherein one of the reactants is a stream of gas.

The use of a subterranean well allows the sewage processing plant to occupy less land surface area.

16.3.79 as US0168.(34pp295).

Heat economising system for boiling beer wort - uses heat pump principle to raise vapours to required temp.
ZENLINST MINIST BEZ 31.03.78-DL-204506
(01.08.79) B01d-01 C12c-07

The principle of the heat pump is used to raise the vapour from a brewing wort boiler, as well as from the condensate detenter, to the energy level of the hot steam necessary for the concentrating of the wort. Liquid condensate is drawn off from the boiler to the detenter, and the hot wort is used regneratively to raise the temperature of the strained or filtered wort and of the cooling water. Due to the use of the heat pump, less than 100% of the normally required energy for boiling the wort, is necessary.

For application partic. in the brewing industry to effect economies in energy consumption when fluids are concentrated and then cooled. The heat available in the hot wort can be recovered practically in its entirety, and heat losses are minimal. 31. 3. 78 as 204506(11pp1045)

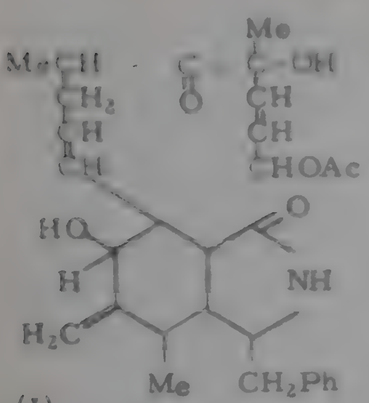
Antibiotic zygosporin a obtained by cultivation of - zygosporium in a nutrient medium

SHIONOGI KK 03.10.66-JA-065294 (12.02.68-DT-695830)
*B04 (18.10.79) *J70008-637 +A61k-31/40 C07d-209/52*

Zygosporin A of formula (I) is new.

Prepn. of (I) comprises propagation of Zygosporium masonii, ATCC 20011, and/or Z. mycophilum, ATCC 20012, in an aq. medium contg. the usual nutrients, under aerobic conditions at about 25-32°C for about 50-150 hr; and cpd. (I) is isolated by the usual methods, e.g., extraction of the mother liquors with EtOAc. The prod. is an effective antiinflammatory agent. 12.2.68 as 695830 (7pp 047)



(I)

MULL/ D16 11305W/07 =DS 2433-414

Liquid gasification esp. for aerobic processes - using rotor near bottom of deep tank with air inlet in venturi throat above

MULLER H 13.07.73-CH-010300

*(18.10.79) *DT2433-414 C12b-01/16*

Above the suction wheel of a centrifugal pump positioned close to the bottom of a fermentation container, a cylindrical guide tube is arranged. This has close to its upper end, a constrictriction, in which the gas feeder body is positioned; the outlets of this being located at the narrowest point of the annular constriction between the body and the tube. The gas feeder body is displaceable axially in the constriction.

Appts. is cheap to install and requires little energy. Since the necessary excess pressure required to circulate O_2 is reduced, economically working, low pressure blowers can be used. 11.7.74 as 433414 (4pp1045)

PROB/ D16 11310Y/07 =DS 2532-859

Baled hops homogeniser - for distribution of homogenised hops to successive brews

PROBST J 23.07.75-DT-532859

*(18.10.79) *DT2532-859 C12c-03*

Beneath a hop bale opener, aligned to its delivery outlet, a conveyor mechanism is arranged. This consists of an endless belt in a frame moved on rollers along rails, so as to distribute the hops into a series of containers, from which they fall on to a second conveyor belt.

Appts. ensures the complete homogenisation of the batch of hops so that its acid content can be determined and a uniform prod. handed over to the brewer. 23.7.75 as 532859 (3pp1045)

Immunoassay method for component of ligand anti:ligand pair - using labelled conjugates forming a signal generating system

SYVA CO 05.04.78-US-893650

B04 J04 R16 (18.10.79) G01n-31/14 G01n-33/16

A method is claimed for determining an analyte which is the ligand or antiligand component of a specifically binding ligand-antiligand pair. The method comprises contacting the sample with the following reagents in an aq. test medium: (a) a reactive conjugate comprising a component of th ligand-antiligand pair labelled with a reactive organic cpd. (I); (b) a signal-forming conjugate comprising a component of the ligand-antiligand pair labelled with a cpd. (II) forming part of a signal-forming system; (c) a signal-mediator precursor which reacts with (I) to form a signal mediator; (d) any auxiliary reagents required for the reaction of (I) and (II); and opt. (e) a polyligand analogue (if the ligand is monoepitopic and a mono-labelled monoligand is used as one of the conjugates).

The signal generated by the signal-forming system is measured and compared with a standard. (I) and (II) can opt. be coupled to the same ligand or antiligand molecule and can themselves be the same enzyme, in which case the signal-mediator precursor must contain more than one enzymatically clearable substituent.

The method can be used for determn. of antigens (esp. globulins, hormones or viral proteins) or haptens (esp. steroids or synthetic drugs). 4.4.79 as 913550 (78pp367)

*(24.10.79) *NL7802-418 C11d-09/40 +C11d-10/04*

Improved enzyme-contg. marumes are prepd. in which a mixt. of enzymes and organic or inorganic extrudable material is extruded, the extrudate being spheronised to form marumes. The extrudable material comprises a potassium soap of 10-18C fatty acids.

Pref. a potassium soap of coconut fatty acids or a superfatted K soap is used. A plasticising agent is added to the mixt. before extrusion. The mixt. or extrudate contains 1-8 wt.% of water, which is removed after spheronisation.

The enzyme-contg. marumes have satisfactory properties w.r.t. enzyme stability and storage stability in detergent powders, without giving rise to dusting problems on handling. 14.3.77. as 010594 (3pp931)

MEIJ D16 82525A/46 =GB 1554-628

Antitumour and antibacterial antibiotic SF-1942 - prepd. by cultivation of e.g. Streptomyces species SF-1942 FERM-P 3939

MEIJI SEIKA KAISHA 02.05.77-JA-049896

*B04 (24.10.79) *DT2818-544 C12d-09/16*

Antibiotic SF-1942 substance (I) is new. (I) is white and electrically neutral and melts gradually from 122-134°C with decomposition. (I) contains, on analysis, 65.57% C, 7.80% H, 26.38% O and 0% N. There is no characteristic absorption max. in UV spectrum, but IR spectrum gives bands at 3400, 2960, 1780, 1710, 1630, 1450, 1390, 1020, 780 cm^{-1} using KBr tablet method.

(I) is prepd. from Streptomyces strain by culturing at 22-32°C under aerobic conditions and is used in treating tumours and cancer. 27.4.78. as 016684 (10pp982)

ESSO ★ D16 77805B/43 ★GB 2018-822

Microbial cells prodn. from methylotropic microorganism strains - useful as feedstuffs and as sources of enzymes

EXXON RES & ENG CO 27.03.79-US-024307 (14.04.78-US-896476)

C03 (D13) (24.10.79) C12k-01 C12k-03

Microbial cells are produced by culturing a selected C_1-utilising microorganism strain aerobically in a liq. growth medium contg. source of N, essential mineral salts and a C_1-cpd. The resulting cells are then harvested.

The micro-organisms used are Methylosinus trichosporium or sporium; Methylocystis parvum; Methylomonas methanica (2 strains), albus; streptobacterium, agile, rubrum (2 strains) or rosaceus (2 strains); methylobacter chroococcum (2 strains), bovis (2 strains) or vinelandii; Methylococcus capsulatus, minimus or capsulatus; Methylobacterium organophilum, each having a respective deposition No. of NRRL B -11202 to 11222. Or Pichia sp., Torulopsis sp. or Kloeckera sp. with the respective deposition Nos. NRRL-Y-11328, 11419, and 11420. Their mutants may also be used.

The microbial cells and enzymes derived from them are useful for increasing the oxidative state of many organic cpds. Typically they can convert 1-6C alkanes to alcohols, 3-6C alkanes to s-alcohols and Me ketones, 3-8C s-alcohols to Me ketones, cyclic hydrocarbons to cyclic hydrocarbyl alcohols, ethylene, propylene, bute-1-ene and butadiene to 1,2-epoxides, styrene to styrene oxide etc. A NAD-dependent s-alcohol dehydrogenase has been found, esp. in cells grown on MeOH, and it specifically and stoichiometrically oxidises 3-6C s-alcohols to ketones. Methane-grown cells are useful as feedstuffs, as they have a high protein content. 12.4.79. as 013062 (48pp1248)

A97 B04 C03 (A14) (06.06.79) C12d-09/14 C12d-13

Rhonomycin is produced by adsorbing phonomycin contg. culture filtrate or culture fungi extract or polyacrylate resin having specific surface area of 100 - 200 cm^2/g and average pore dia. 200 - 280 Å and then eluting adsorbed substance.

Rhonomycin is useful antibiotic of polyether gp. that inhibits growth of Gramm-positive bacteria produced in culture liquor and fungi body by actinomyces, mould, mycoplasma, protozoa and coccidium. 15.11.77 as 136186 (3pp69).

TOKR- ★ D16 77892B/43 ★J5 4117-379
Contact type device for reacting solid or liq. with gas - includes reactor column, vertical duct open at both ends, gas dispersing device below duct, for introducing bubbles
TOKYO RIKAKI KIKAI 06.03.78-JA-025230
E17 (12.09.79) B01j-10 C12b-01

A device is used to react a liquid or solid compound such as organic compounds with a gas such as oxygen for oxidising reactions for selectively oxidising glucose into gluconic acid, using a fixing oxidising enzyme. The object is to make the gas and liquid phases uniformly dispersed and mixed at high yield.

The device comprises a reactor column, which contains a vertical duct having openings at both ends, and a member for dispersing the gas phase and introducing bubbles only into the duct. The dispersing member is located below the duct. The liq. is poured into the column up to above the upper end of the duct, and the gas is fed into the same through the member in the form of bubbles. The enzyme is solid. 6.3.78 as 025230 (4pp26).

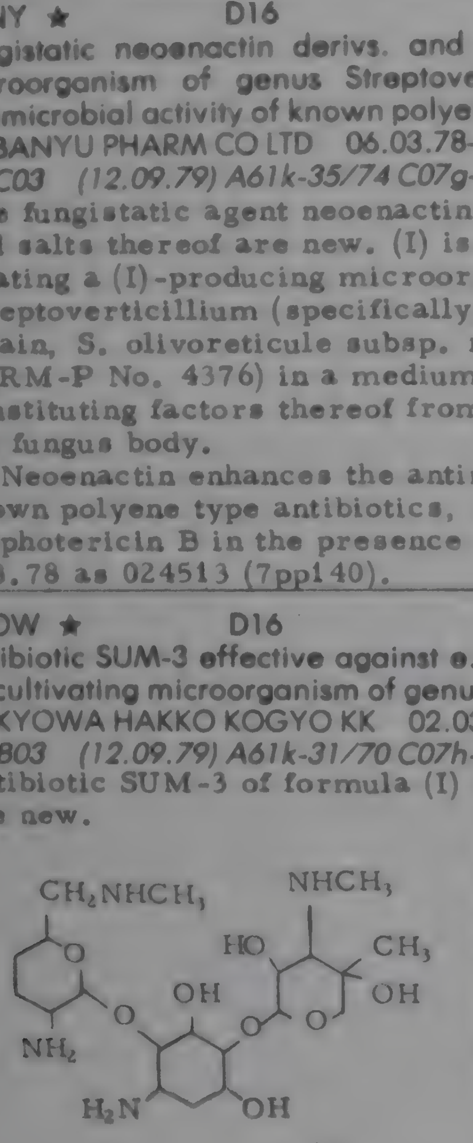
BANY ★ D16 77906B/43 ★J5 4117-401
Fungistatic neoenactin derivs. and salts - prepd. by cultivating microorganism of genus Streptoverticillium, used to enhance antimicrobial activity of known polyene antibiotics
BANYU PHARM CO LTD 06.03.78-JA-024513
C03 (12.09.79) A61k-35/74 C07g-11 C12d-09/14

The fungistatic agent neoenactin (I) and functional derivs. and salts thereof are new. (I) is prepd. by aerobically cultivating a (I)-producing microorganism belonging to genus Streptoverticillium (specifically, a newly discovered strain, S. olivoreticule subsp. neoenacticus H 829-MY10, FERM-P No. 4376) in a medium and recovering (I) or constituting factors thereof from the culture filtrate and the fungus body.

Neoenactin enhances the antimicrobial activity of known polyene type antibiotics, e.g., trichomycin or amphotericin B in the presence or absence of cholesterol. 6.3.78 as 024513 (7pp140).

KYOW ★ D16 77935B/43 ★J5 4117-477
Antibiotic SUM-3 effective against e.g. Proteus vulgaris - produced by cultivating microorganism of genus Micromonosporum
KYOWA HAKKO KOGYO KK 02.03.78-JA-022790
B03 (12.09.79) A61k-31/70 C07h-15/22 C12d-09/14

Antibiotic SUM-3 of formula (I) and its acid addn. salts are new.



(I)

(I) and its salts are effective against Staphylococcus aureaus 209P, Bacillus subtilis ATCC 6633, Echerichia coli NIHJC-2, Proteus vulgaris ATCC-6897, Pseudomonas aeruginosa KY8510.

Prepn. comprises cultivating a microorganism belonging to genus Micromonosporum and capable of producing antibiotic SUM-3 (e.g. M. sagamiensis SU-2, FERM-P No. 4230, NRRL-11,182) in a nutritive medium and recovering antibiotic SUM-3 from the culture. A liquid culture, partic. a submerged culture is pref.. Cultivation is conducted at 25-40°C at neutral pH.

Antibiotic SUM-3 is isolated and purified according to known techniques employed for purification of water-soluble and basic antibiotics, i.e., adsorption on cation exchange resin, cellulose column chromatography, adsorption on Cephades LH-20 (RTM) column, silica gel chromatography or carbon chromatography. The free base or the sulphate of antibiotic SUM-3 can be isolated and purified taking advantage of the difference in solubility in acetone. 2.3.78 as 022790 (10pp140).

AGEN ★ D16 77941B/43 ★J5 4117-500
Extracting substance for accelerating alpha-1,6 glucosidase prodn. - by treating rapeseed refuse at pH not above 5
AGENCY OF IND SCI TECH 03 03 78-JA-024156
(12 09 79) C07g-07/02

Extn. of substance useful as an accelerator for bacterial prodn. of α-1, 6-glucosidase comprises subjecting rapeseed refuse to treatment at pH ≤ 5.

The effective component is useful not only as an accelerator in prodn. of α-1, 6-glucosidase but also enhances the prodn. of various enzymes such as β-amylase and, further, it is effective for increasing the propagation of various microorganisms.

In an example, 100 g. of rapeseed refuse was suspended in 1.5 l distilled water, which was adjusted to about pH 4 with HCl followed by extrn. with stirring at 40°C for 6 hours. The pH of the extract was adjusted to 3 with HCl, followed by subjecting it to centrifuge to obtain extract soln.. The extract soln. was concentrated to about 150 ml. under reduced pressure. To the concentrate was added 150 ml. of C_2H_5OH. The resulting pptes. were collected by centrifugal machine, then dried. The dry prod. gave a wt. of 4.08 g. With this substance, prodn. potency of α-1, 6-glucosidase by Bacillus cereus var. mycoides showed 1.01 x 10^7. The yield of the effective component based on the extract was 94.1%. 3.3.78 as 024156 (4pp75).

DAIN ★ D16 78142B/43 ★J5 4119-02
Kit for quantitative enzyme immunoassay - comprises reagent c e.g. anti:epileptics labelled with different enzymes and antibod for the anti:epileptics
DAINIPPON PHARM KK 06.03.78-JA-025719
B04 J04 R16 (14.09.79) G01n-31/22 G01n-33/16

The kit comprises (1) reagent A comprising ≥ 2 antiepileptics or cpds. having the partial structure which are labelled with different enzymes, respectively and (2) reagent B comprising an antibody against the antiepileptics or cpds. having the partial structure.

The kit can detect two or more antiepileptics in the serum of patients simultaneously. Since effective dose of antiepileptics is very close to their toxic dose, it is necessary to examine the blood level of the antiepileptics during treatment of patients. Examples of the antiepileptics are diphenylhydantoin, phenobarbital, primidone, carbamazepine and trimethadione. The enzyme for labelling antiepileptics includes β-galactosidase, glucose oxidase, lipase, alkali phosphatase and peroxidase. 6.3.78 as 025719 (12pp33).

Coenzyme/q-10 prodn. - culturing strain of microcyclus methanolic in medium contg. assimilable carbon sources
MITSUBISHI GAS CHEM IND 09.03.78-JA-026942
B05 (14.09.79) C12d-13 C12k-03

Production of Coenzyme Q_{10} comprises cultivating strain of Microcyclus methanolica in a medium containing assimilable carbon sources, separating the bacterial bodies from the cultured broth and recovering coenzyme Q_{10} from the bacterial bodies.

Coenzyme Q_{10} is known to be useful as a drug for treatment of emphysema, of the lungs, depilatory disease, anaemia or muscle asthenia or as cardiovascular agents.

Specifically the cultivation of Microcyclus methanolica is effected aerobically in a medium contg. assimilable carbon sources at 20-42°C (25-40°C) at pH 5-9 (6-8). 9.3.78 as 026942 (9pp).

KOBA/ ★ D16 78155B/43 ★J5 4119-080
Enzyme for de-conjugation of tauro-bile acids - is obtd. by cultivating intestinal microorganism; used to examine fa absorption, cholesterol metabolism and bile acids circulation
KOBASHI K 06.03.78-JA-025268
B04 (14.09.79) C12d-13/10

The enzyme has the following characteristics: (1) it acts on taurocholic acid, taurodeoxycholic acid and taurochenodeoxycholic acid among tauro-bile acids, but does not act on glyco-bile acids, (2) its optimum pH is 5.0-6.0, (3) its stable pH is 4.0-10.0, (4) its optimum temp. is 45°C, and (5) it is stable on heating at 50°C for 10 minutes.

The enzyme hydrolyses specifically tauro-conjugates among conjugated bile acids and is therefore useful in the clinical field to examine fat absorption, cholesterol metabolism and bile acids circulation.

The enzyme is produced by cultivating an intestinal microorganism and recovering from the cultured broth an enzyme which acts on tauro-bile acids specifically, but does not act on glyco-bile acids. The microorganism is e.g. Peptostreptococcus intermedium No. 619 (FERM-P No. 4428), Eubacterium rectale (FERM-P No. 4427), Streptococcus faecalis P (FERM-P No. 4429) and Saccharomyces carlsbergensis (FERM-P No. 4430). 6.3.78 as 025268 (4pp33).

KOBA/ ★ D16 78156B/43 ★J5 4119-081

Glyco-bile acid-de:conjugating enzyme - prepd. by culturing e.g. Streptococcus faecalis or Lactobacillus brevis strains pref. under anaerobic conditions

KOBASHI K 06.03.78-JA-025269

B04 (14.09.79) C12d-13/10

New glyco-bile acid-deconjugating enzyme has the following characteristics: (1) it is capable of deconjugating glyco-bile acids such as glycocholic acid, glycodesoxycholic acid, glycochenodesoxycholic acid, etc., but incapable of deconjugating tauro-bile acids; (2) the optimum pH is 5.0 - 5.5; (3) it is stable at pH 4-9; (4) the optimum temp. is 35°C; (5) it is 50% inactivated by heating at 45°C for 10 min.; and (6) it is stabilised by addn. of a mercapto cpd..

The enzyme is prepd. by cultivating Streptococcus faecalis II-136 (Ferm-P Np. 4432), Lactobacillus brevis 216 (Ferm-P No. 4431), Streptococcus faecalis Bm Sporolactobacillus inulinus or Bifidobacterium adolescentis in a nutrient medium and recovering the enzyme activity from the cultured borth. The fermentation is pref. carried out under anaerobic conditions. The enzyme is greatly stabilised by mercaptoethanol or thioglycolic acid at a level of 10^{-3}M.

The enzyme is useful for diagnosis and medical treatment. No specific use is given. 6.3.78 as 025269 (4pp16).

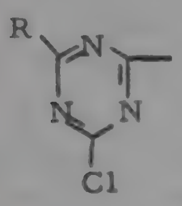
A96 B04 (14.09.79) C07d-07/02 C12d-13/10

A modified asparaginase lacking antigenicity claimed where ⩾85% of the amino groups in L-asparaginase molecule are substd. by a gp. of formula (I) where R is a residue of water-soluble high polymer having a mol.wt. > 2,000.



(I)

Used to enhance the safety of cancer therapy (anticancer) with L-asparaginase.

As the substit. R, residues of polyethylene-glycol, PVA, polyvinyl-pyrrolidone and carboxy-methylcellulose may be employed. The mol.wt. of such high polymers must be ⩾2,000, pref. 5,000. It is also pref. that the terminal of such residues is masked with an alkyl such as methyl, ethyl or propyl or an acyl such as acetyl or benzoyl. In a medium kept at pH 9, L-asparaginase is reacted with 5 to 10 moles of 2-O substituted polyethylene-glycol-4, 6-dichloro-s-triazine per amino group of the enzyme under a condition which does not cause protein denaturation, though the O-substituted polyethyleneglycol residue in the above reactant may be replaced by other polymeric residues. 8.3.78 as 026343 (3pp).

Thermo-resistant superoxidedismutase prepn. - by crushing Thermus bacteria, adding deoxyribonuclease to decompose dna, allowing to stand and adsorbing top clear layer

MITSUBISHI CHEM IND KK 09.03.78-JA-026907

A97 B04 (A11) (14.09.79) C12d-13/10

Method comprises (a) crushing the bacterial body of Thermus, (b) adding deoxyribonuclease to the crushed prod. to decompose DNA, (c) standing the reaction mixt. and (d) treating the top clear with diethylamino-ethylcellulose to adsorb superoxide dismutase.

As the bacteria, highly thermophilic bacteria Thermus thermophilus HB8(ATCC 27634), Thermus flavus BS1, AT-61, AT62, etc. can be used. Pref. the bacteria is cultured at 75°C for 6 hours and the bacterial body is collected at logarithmic phase.

Thermo-resistant superoxide dismutase is prepd. easily. The crude enzyme can be refined by combining fractional pptn. diethylaminoethyl-cellulose column chromatography, CMC column chromatography, etc., 9.3.78 as 026907 (4pp5).

SUMO ★ D16 78159B/43 ★J5 4119-084

Carrier for fixing enzymes - comprises macroporous amphoteric ion exchange resin contg. carboxymethyl gp.

SUMITOMO CHEMICAL KK 08.03.78-JA-026913

A96 B04 (14.09.79) B01j-01/08 C07g-07/02

The carrier is a macroporous amphoteric ion exchange resin which has cation exchange capacity > 0.5 meq/g-dry resin through carboxymethyl group, anion exchange capacity >1 meq/g-dry resin through anion exchangeable group, specific surface area >1 m^2/g-dry resin and total volume of the macropores having 100-2000 A dia. > 0.1 cc/g-dry resin. The carrier is produced by reacting the cpd. XCH$_2$COOY (I) with the macroporous anion exchange resin which has the functional group reactive with (I) in the presence of alkaline compound so that carboxymethyl group is introduced in the resin above 0.5 meq/g-dry resin.

In (I) X is halogen atom, Y is hydrogen atom or alkali metal.

Enzymes can be fixed by adsorption and by covalent bonding. Relatively large amt. of enzyme can be adsorbed on the resin.

The fixed enzyme obtained by adsorption has good durability of enzymic activity, and the fixed enzyme obtd. by covalent bonding method has good specific activity, and stability in electrolytic solution. Enzymes such as pronase, aminoacylase, glucoseisomerase, lactase, nuclease, β-amylase, isoamylase, pullulanase, urease, deaminase, lipase, esterase, protease, etc. can be fixed. 8.3.78 as 026913 (11pp5).

Biochemical oxidn. of alcohol and aldehyde - involves oxidn. reaction with dehydrogenase and NAD and conversion of obtd. NADH to NAD for use in oxidn. reaction
AJINOMOTO KK 09.03.78-JA-027099
(D13) (14.09.79) C12d-01/02 C12d-13

Method consists of (a) the reaction to form reduced-form nicotinamide-adeninedinucleotide (abrr. NADH) and to oxidise alcohol or aldehyde simultaneously by contacting the alcohol or the aldehyde (which can be oxidised by dehydrogenase in the presence of oxidised-form nicotinamide-adeninedinucleotide(abbr. NAD)), with fixed dehydrogenase and NAD for oxidising the alcohol or the aldehyde and reducing NAD to NADH simultaneously, and (b) the reaction to oxidise NADH to NAD by contacting NADH with the fixed enzyme obtd. by fixing the microbial body or the treated prod. of the microbial body which can oxidise NADH to NAD and belongs to Arthrobacter, Bacillus, Leucosporidium or Candida, in the presence of oxygen.

The oxidation of alcohol or aldehyde can be carried out under moderate conditions. Alcohol can be oxidised to corresponding aldehyde and the selective oxidation of formyl group or hydroxyl group of aldehyde can be practiced. Thus, the method can be adapted not only for preparing aldehyde, carboxylic acid, etc., but also for oxidising the alcohol or the aldehyde in foods and drinks, etc..

The reactions (a) and (b) may be practiced simultaneously or in order, and the reactions can be practiced repeatedly. Microbes such as Bacillus coagulans IFO 3557, Leucosporidium capsulidienam IFO, 1119, Candida tropicalis IFO 0589, etc. can be used. 9.3.78 as 027099 (5pp5).

Microbial prepn. of glycolic acid - by culturing Candida yeast strain in medium contg. ethylene glycol
AGENCY OF IND SCI TECH 09.03.78-JA-026897
E17 (14.09.79) C12d-01/02

The method is effected by culturing an yeast strain of Candida in the culture medium contg. ethyleneglycol and recovering formed glycolic acid from the cultured medium. Glycolic acid can be used for demineralisation in leather industry, finishing in textile industry, etc.. The yeast strain can oxidise ethyleneglycol to glycolic acid.

The yeast strain has been identified Candida tropicalis (FERM-P 4415). Practically ethyleneglycol is combined 2-20% pref. 5% in the culture medium. The yeast strain can not utilise ethyleneglycol as the carbon source and pref. hydrocarbon such as normal paraffins is used. The culture is practiced at 20-40°C pref. 30°C at pH 2-9 pref. 6-8 in the presence of sedimenting calcium carbonate. Formed calcium glycolate is dissolved by heating and the yeast body is removed by centrifuging. 9.3.78 as 026897 (4pp5).

Biodegradable film - comprises polyesteramide contg. ester blocks of aliphatic polyester and amide blocks of aliphatic polyamide alternately bonded together

AGENCY OF IND SCI TECH 09.03.78-JA-026891
A23 (17.09.79) C08g-69/44

A biodegradable film is moulded from a copolymer in which are alternately bonded together the ester blocks of low mol.wt. aliphatic polyester and the amide blocks of low mol.wt. aliphatic polyamide.

The ester blocks are of formula $-\left[-\mathrm{O}-\mathrm{X}-\mathrm{CO}-\right]-_n$ (I) (where X is -R_1OOCR_2- or -R_3- (where R_1 is 2-20C alkylene group, R_2 is 0-12C (sic) alkylene group, and R_3 is 1-5C alkylene group); and n is 10-40. The amide blocks are of formula $-\left[-\mathrm{NH}-\mathrm{Y}-\mathrm{CO}-\right]-_m$ (II) (where Y is -R_4-NHCOR_5- or -R_6- (where R_4 is 0-12C(sic) alkylene group, R_5 is 0-12C (sic) alkylene group, and R_6 is 1-12C alkylene group); and m is 1-10.

This film has a high melting point suitable for practical uses, and yet has the biodegradable property.

The polyester-amide copolymer is e.g. prepared from poly-caprolactone 1.0 g and nylon-6 1.0 g by ester-amide exchange reaction catalysed by zinc acetate anhydride 10 mg (0.5 wt.%) at 270°C for 150 minutes. 9.3.78 as 026891 (6pp128).

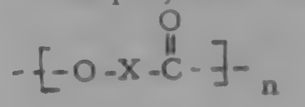
AGEN ★ D16 78352B/43 ★J5 4119-595

Biodegradable polyesteramide copolymer - comprising alternating blocks of aliphatic polyester and aliphatic polyamide

AGENCY OF IND SCI TECH 09.03.78-JA-026889
A23 (17.09.79) C08g-69/44

A biodegradable polyester-amide copolymer has a structure comprising ester block A of low mol.wt. aliphatic polyester and amide block B of low mol.wt. aliphatic polyamide bonded alternately. The copolymer is prepd. by heating the mixt. of high mol.wt. aliphatic polyester and high mol.wt. aliphatic polyamide above their m.pt. performing ester-amide exchange reaction until a reaction prod. having a decreased m.pt. is obtd..

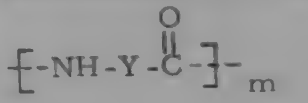
The polyester block A is of formula (I) where X is



$$-\left[-\mathrm{O}-\mathrm{X}-\overset{\mathrm{O}}{\overset{\|}{\mathrm{C}}}-\right]-_n$$

(I)

-R_1OOCR_2- or -R_3- (where R_1 is 2-20C alkylene gp. R_2 is 0-12C alkylene gp. and R_3 is 1-5C alkylene gp.). n is 10-40). The polyamide block B is of formula (II) (where Y is -R_4-NHCOR_5- or -R_6- (where R_4 is 0-12C alkylene gp., R_5 is 0-12C alkylene gp., and R_6 is 1-22C alkylene gp.) m is 1-10).



$$\left[-\mathrm{NH}-\mathrm{Y}-\overset{\mathrm{O}}{\overset{\|}{\mathrm{C}}}-\right]-_m$$

(II)

In an example, the polyester-amide copolymer is prepd. from polycaprolactone 1.0 g and nylon-6 1.0 g by ester amide exchange reaction catalysed by Zn acetate anhydride 10 mg (0.5 wt.%) at 270°C for 150 minutes. The copolymer 50 mg is decomposed by lipase 0.2 mg dissolved in 0.2M phosphoric acid buffer soln. 0.5 ml at 37°C for 16 hours. The total organic carbon solubilised by the enzyme is 1180 ppm. 9.3.78 as 026889 (6pp128).

Purificn. of proteolytic enzymes - by sorption on addition prod. of bacitracin and agarose activated by cyanogen bromide (SW 9.1.78)

IND MICROORG GENETI (STEP/) 09.06.76-SU-370306

*B04 (30.01.79) *US4100-028 C07g-07/02*

Proteolytic enzymes with high degree of purity and activity are obtd. by biospecific sorption of the dissolved enzymes on an insol. carrier bacitracin-sepharose 4B obtd. by activating sepharose 4B, a derivative of agarose with cyanogen bromide and covalently bonding the antibiotic bacitracin thereto as a ligand, with subsequent elution of the sorbed enzyme using solns. of buffer salts. The method gives yields of 75-95%, with activity increased by 2-500 times, effectively extracts enzymes from culture liquids contg. coloured impurities, and may be used over a wide range of pH 1.8-8, thus rendering it useful in sepn. of proteolytic enzymes, e.g., metallo-proteinase and exopeptidase.

Fungal strain Aspergillus fischer Wehmer no. 75 - is used as a test culture in sterilisation of fruit juices and preserves

MOLD FOOD IND RES 04.10.76-SU-410000

(D13) (30.01.79) A23l-03 Ci2k-01/02

Fungal strain Aspergillus fischeri Wehmer No. 75 is used as a test culture in the sterilisation of fruit juices and preserves. Colonies extend over the substrate and are velvety, fluffy and initially white, becoming cream or dark cream. The inverse side in a young growth is yellow with orange overtones.

Conidial spore carriers appear in a 3-day growth at 37°C and very quickly become uticular. The conidial heads are columnar and compact measuring 15-21μ. The sterigmi are in one group about 6-8μ densely arranged on an axis parallel to the conidia.

la dodecyl-benzene-sulphonate is used as a nutrient me-lium sterilising agent in the cultivation of Gram-negative nicroorganisms. In a typical method 0.05g. are added per 100g. of nutrient agar, broth, liq. etc. and then the nedium is boiled for 5 mins. The agent does not affect he nutrient props. of the medium but ensures its steril-ty for 7-14 days. Serov, G.D., Sheverdina, F.N. Bul 4/30.1.79. 11.8.77. as 518426 (2pp314)

HEAT= ★ D16 78641B/43 ★SU-644-836
Measuring moisture stability of microorganisms - using moisture adsorbent and calculating amount of adsorbent required for mixing with biomass
HEAT-MASS-TRANSFER 02.02.76-SU-320707
(06.04.79) C12k-01

The moisture stability of microorganisms is measured by mixing a sample of the biomass with a water-adsorbing agent and measuring the number of viable microorganisms The amt. of adsorbent required for mixing is calculated by the relation $G_2 = (G_1\ \Delta u)/(U_k . C_{m_1}/C_{m2})$, where G_1 and G_2 are the absolute dry wts. in kg. of the biomass and the adsorbent; $\Delta U = U_H - U_K$ which is the moisture content gradient in kg./kg. U_H and U_K are the initial and final moisture content of the biomass in kg./kg; and C_m and C_{m_2} are the mean isothermic mass capacity of the biomass and adsorbent in mols./joule.

By calculating the amt. of adsorbent required, the accuracy of the process is improved.

Prepn. of cold water insoluble starch prods. - by gelatinising a starch mixt. then treating with aq. salt soln.
COOP VERKOOP AVEBE 24.02.78-GB-007562
A11 (24.10.79) C13l-01/08

Prepn. of cold water insoluble starch prods. involves (a) forming a dry mixt. or an aq. suspension of ⩾2 types of starch; (b) gelatinising the mixt. or gelatinising and drying the suspension to give a dry cold water soluble starch. Then (c) preparing a suspension of this starch in an aq. soln. of a salt that raises the swelling temp. of the starch and (d) recovering the prod.

The prods. can have selected specific properties, depending on the starting starches used; they can easily be chemically cross-linked to improve their properties. The prods. are useful in the paper or textile industry, in adhesives, in processed foods, in pharmaceuticals and in cosmetic prods. 8.5.78. (5pp1248)

ASAF ★ D17 78093B/43 ★J5 4118-488
Sepg. aldose(s) from ketose(s) - by treating sugar mixt. with specified polymer, e.g. aminated chloromethyl-styrene-di:vinyl benzene copolymer
ASAHI DOW KK 06.03.78-JA-025289
A97 (A18 A21 A23) (13.09.79) B01d-15 C08f-08/32

Aldoses are separated from ketoses by treating sugar mixture with (1) a polymer comprising 0 - 96 mol % monomer(s) of formula $-\!\!(CH_2-CR_1R_2)\!\!-$ where R_1 is H or CH_3 and R_2 is phenyl, and/or 3 other specified monomers; 2 - 98 mol % of monomer(s) of formula $-(CH_2-CHNH_2)$ or 3 other specified monomers; and 2-40 mole % of a cross-linking agent e.g. divinylbenzene, tolylene diisocyanate etc.; or (2) a polymer deriv. of cellulose, polyamide or phenol resin contg. NH_2 equivs. and each having a degree of swelling of 20 times with water.

In an example, chloromethylstyrene/divinylbenzene copolymer (mol. ratio of 98: 2) is aminated by Delepine reaction to prepare cross-linked polyvinylbenzylamine (having adsorption capacity of 3.8 meq/g for HCl). The product (0.5 g) is sampled in a test tube and added with an aqueous soln. (10 ml) contg. 0.1 g of glucose and 0.1 g of fructose. The mixture is heated at 70°C for 30 min. and the adsorption is determined to be 53 mg for glucose and 1 mg for fructose per g of the resin, unlike polyvinyl-N-methyl-benzylamine or Amberlite IR-93 which show no adsorption. 6.3.78 as 025289 (10pp).

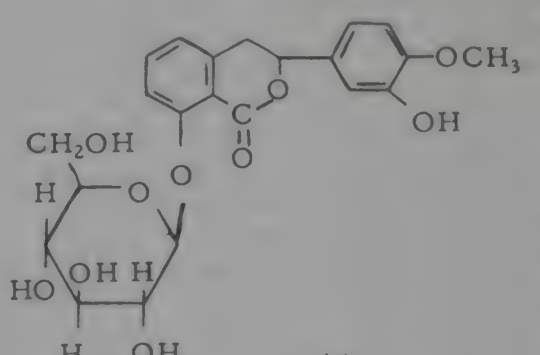
Hydroxy-methoxy-phenyl-di:hydro iso:coumarin-8-O beta-D-glucose - used as tobacco flavour improving agent
JAPAN TOBACCO & SALT PUB 06.03.78-JA-024442
E13 P15 (12.09.79) A24b-15/04 C07h-17

The isocoumarin deriv. of formula (I) is new. It is used as an agent for improving tobacco flavour.



(I)

In the prepn. of (I) raw leaves of Hydrangea macrophylla seringe var Thunbergii Makino are subjected to extraction with water, hot water or a hydrophilic solvent such as methanol, ethanol or dioxane, or its mixture with a hydrphobic solvent such as benzene, ether, dichlromethane or chloroform. The extract solution is filtered. The filtrate is evaporated to dryness under reduced pressure. From the residue is removed the portion soluble in ether. To the remaining material is added water, and the aq. mixture is subjected to extraction, followed by filtration. The extract solution is passed through a column packed with weakly cationic ion exchange resin so that polyphenol type material is adsorbed on the resin, and the adsorbed material desorbed with methanol or ethanol. The eluate is purified by conventional manner to obtain (I) as white needles. 6.3.78 as 024442 (4pp75).

BRUS/ ★ D18 78643B/43 ★SU -644-841
Chrome-tanning leather, e.g. pigskin - by preliminary de-liming, softening and treating with urea to loosen collagen structure and to facilitate tanning
BRUSILOVSKII M I 28.01.77-SU-446677
E16 (02.03.79) C14c-01 C14c-03/06

Leather (e.g. pigskin) is produced by deliming the hide, softening it, treating with an amino cpd. and chrome-tanning.

The quality of the product is improved by using urea as an amino cpd. This process is less expensive than the conventional process involving the use of dicyandiamide

resin, and the strength of the product is increased (tensile strength is increased from 20 to 21 MPa).
Brusilovskii, M.I., Shapirov, V.S., Lysunets, B.P. et al. Bul. 4/30.1.79. 28.1.77. as 446677 (2pp70)

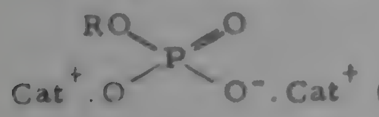
Aq. compsn. for degreasing collagen-contg. materials - contg. soda, higher alkyl phosphate ester salt and nonionic detergents, used in catgut, gelatin leather etc. mfr.

CHISTYAKOV B E 21.02.77-SU-461622
(02.03.79) C14c-01/08

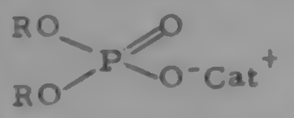
Aq. compsn. is used for degreasing collagen-contg. materials, esp. intestines for the prodn. of strings or catgut, and in leather-fur and gelatin-glue mfr. It contains soda and a surfactant and is improved by using as surfactants a mixt. of 10-20C alkyl phosphate ester salts pref. with triethanolamine or potassium, and nonionic detergent.

The compsn. contains (in wt.%) soda 20-50, 10-20C alkyl phosphate salts with triethanolamine or potassium 10-20, synthanol 20-60, the balance is water. This compsn. is highly effective as a decreasing agent and, in addition, it exerts bleaching action.

The phosphate ester salts have formula (I) or (II):



(I)



(II)

(where R is normal or sec. 10-20C alkyl; and Cat$^+$ is $(C_2H_4OH)_3NH^+$ or K^+). The nonionic detergents Sintanol (RTM), are $RO(CH_2CH_2O)_nH$ (where R is 10-18C alkyl; and n is 10-14) This the product of ethoxylation of higher 10-18c alcohols.

Tool for cutting parallel lines in leather - using adjustable cut blade assembly operating in slots

MADL J 30.10.74-DT-451528
*+P62 (05.02.79) *BE-831-904 C14b-15*

Tool for cutting parallel strips in raw hides comprises group of draw cutters arranged at regular intervals in rows placed one behind the other and fixed perpendicula to the direction in which the tool is drawn during use. The cutters are fixed in a blade carrier which is applie against a supporting plate; this has an extension to whi the handle is attached. A convex base-plate, below the blade carrier, is fitted with slots through which the cutters pass; they form a type of comb. An adjustable, knurled-head screw fixed between the arms control in depth of penetration of the blades into the upper surface of the leather, so that the very delicate layer of wool below the fleece will not be damaged.

The tool is simple and light to handle; the cuts can b made by progressive press. It is possible to pass rapic from one type of skin to another without adjusting the parallelism of the blades and the slots.

Microbicide for industrial cooling water and paper pulp - contg. 4,5-di:chloro-1,2-dithiol-3-one, a polyoxyethylene, polypropylene ethylene di:amide or alkylolamide surfactant and hydrophilic solven
KATAYAMA CHEM WKS C (YOSH) 11.04.78-JA-043697 (05.04.78-JA-040620)
A97 C03 F09 P34 (A25 D15) (18.10.79) A61l-13 C02b-03/06 C23f-14/02 D21c-11

A stable microbicide for industrial use comprises (I) 3-20 pts. wt. 4,5-dichloro-1,2-dithio-3-one as active ingredient (II) $\geqslant 0.2$ pts. wt. (per 10 pts. wt. (I)) of a surfactant, chosen from N, N, N', N'-polyoxyethylene polypropylene ethylenediamine and a nonionic alkylolamide surfactant, and (III) a hydrophilic organic solvent to give 100 pts. wt. of the formulation. The resulting formulation is anhydrous.

The microbicide is esp. suitable for controlling slime in paper broth and paper mfr., and in industrial water cooling systems. The microbicide can be used in general, in water systems. The active ingredient is satisfactorily dispersed, for full bactericidal and fungicidal effect, and because the amt. surfactant needed is very small, there are no difficulties as a result of foaming. In addition, the microbicide does not affect the properties of the paper. 4. 4. 79 as 913593 (20pp1401)

NIRA ★ D22 77682B/43 ★DT 2914-822
Wound healing material - comprising coagulation factor XIII fixed to a structure e.g. gelatin, collagen, poly:glycolic acid or poly:lactic acid
UNITIKA KK 24.10.78-JA-131116 (12.04.78-JA-043666)
A96 B04 P34 (18.10.79) A61k-35/14 A61l-15/04

New material for the healing of wounds comprises a structure to which is fixed blood coagulation factor XIII. Pref. materials have both factor XIII and thrombin fixed to the structure, the thrombin and factor XIII pref. being in amts. sufficient to promote the formulation of stabilised fibrin. Calcium ions and a pharmaceutically active substance (pref. antiplasmins, antibiotics, antivirals, sulphonamides or anti-infective agents) are also advantageously fixed to the structure.

Provides long-acting preparations which utilize the effectiveness of factor XIII in stabilising fibrin formed in the wound. Stabilisation of fibrin prevents its breakdown resulting in renewed bleeding and retardation of wound healing. 11. 4. 79 as 914822 (25pp280)

Bactericidal liq. spray to disinfect interior of buildings - with liq. droplets pumped into atmos. or air conditioning duct
PARAGERM FRANCE SA 13.01.78-FR-000865
P34 P42 (14.09.79) A61l-09/04 B05b-09/04

The equipment comprises a power driven hydraulic pump drawing liq. from a container. The pump delivers liq. via a pipe terminating with a directional nozzle discharging tiny droplets of liq. into the atmos. The nozzle can be free for manipulation by an operator or fixed to delivery always in the same position. A fixed nozzle can be installed inside air conditioning ducting to deliver downstream into air current.

When located to deliver into an air conditioning duct or open atmos., the pump is pref. operated intermittently by a programmed timer. For manual use, the nozzle can be fitted at the end of a pipe lance so that walls and ceilings can be directly sprayed.

The spray is liq. droplets rather than an air/liq. emulsion. Consequently, a compact unit can delivery liq. at a faster rate than previous equipment. 13. 1. 78 as 000865 (11pp448)

(III) and (IV) can be used as UV screeners in the plastic industry eg they can be used in polyolefin resin formula ons to prevent degradation by sunlight. (III) is also acti against bacteium sarcina lutea and can be used to swab laboratory benches etc. 31.8.78 as 938686 Div. ex 41374 (8pp924)

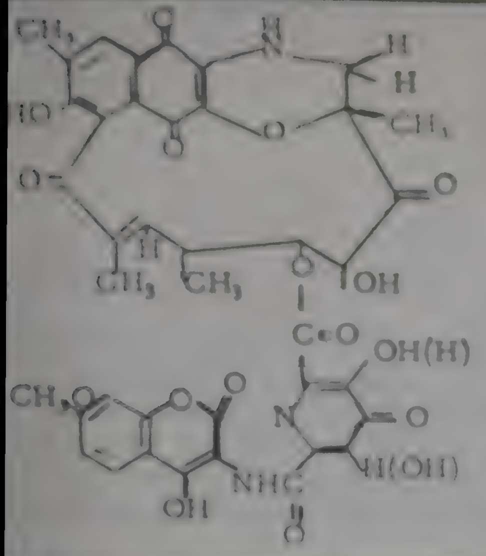
UPJO D22 84365A/47 =US 4171-4

Decomposition prods. of rubradirin antibiotics - useful antibacterials, UV stabilisers for polyolefin and pharmaceu intermediates

UPJOHN CO 06.02.78-US-874767 (05.05.77-US-793785)

*A60 B02 E13 + P34 (16.10.79) *DT2816-052 C07d-265/28*

Novel degradation prod. of antibiotic rubradirin is a cpd of formula (V). The acylates of (V) are described where



the acyl gp. consists of 2-28C hydrocarbon carboxylic acid acyl, including halo, nitro, hydroxy, amino, (thio) cyano, and lower alkoxy-substd. hydrocarbon carboxylic acid acyl.

Reaction of (V) with a satd. soln. of ammonia and methanol gives a novel cpd. useful as an UV screener in the plastics industry. Further similar cpds. have anti-bacterial activity. 31.8.78 as 938603 Div. ex 4137140 (7pp924)

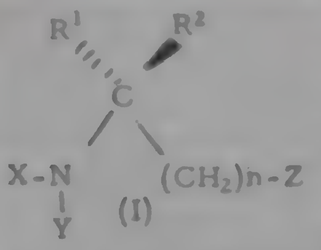
INTE- ★ D22 79063B/43 ★ US 4171-452

N-Chloro-amino ester derivs. of alkyl carboxylate(s) - useful as antibacterials and antifungals not inactivated by blood serum and incorporated e.g. in mouth-washes

INTERX RES CORP 16.05.77-US-797469 (14.11.75-US-632012)

B03 C02 E16 (D21) (16.10.79) C07c-69/02

New N-chloramino ester derivs of alkyl carboxylates are of formula (I) (where X and Y are each H or Cl provided that they are not both H; R^1 and R^2 are each 1-20 Cn- or branched alkyl, n is 1-8; and Z is $-OOCR^3$, in which R^3 is 1-6C n- or branched alkyl). One preferred cpd. is 2-N-chloroamino 2-methyl-1-propyl acetate.



(I)

The cpd. exhibit antibacterial and antifungal activity. They remain stable in the 'neat' state, remain active over varying pH conditions and are not inactivated as antibacterial agents by denaturants such as blood serum, and are biodegraded into non-toxic products. The cpds. may be included in e.g. mouthwashes, shampoos, soaps and cosmetic bases.

US4036843 claimed antibacterial and antifungal chloro-aminoesters of pyridinecarboxylates. 16.5.77 as 797469 Div. ex 4036843 (10pp990)

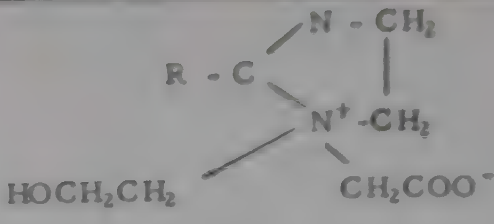
The detergent compsn. is prepd. by dissolving Na hydrogen carbonate ($NaHCO_3$), K hydrogen carbonate ($KHCO_3$), sodium sesquicarbonate ($Na_2CO_3.NaHCO_3.2H_2O$), 2-alkyl-N-carboxymethyl-N-hydroxyethyl-imidazolium-betain of formula (I) (where R is alkyl); (which affords less irritation to eyes and skin, has stabilised foaming activity, stabilised activity against sea water and hard water, excellent compatibility with cationic, anionic and nonionic detergents and is susceptible to microbial decompsn.



(I)

of > 98%), an aliphatic monoethanolamine of formula $RCONHCH_2CH_2O$ (II) (where R is aliphatic group) (an anionic detergent prepd. by adding an aliphatic alkylolamide with ethylene oxide and having protective activity against skin irritation, strong resistance against alkali and sea water and being susceptible to microbial decompsn. of > 98%) and a minor amt. of 12-14C aliphatic diethanolamide of formula $RCON(CH_2CH_2O)_2$ (III) (where R is 12-14 C aliphatic group) (having high rust inhibiting action and being susceptible to microbial decompsn. of > 99%) in water.

The compsn. can wash textiles in a short time. They are defoamed in a short time and do not irritate the skin or kill microbes in river water. 16.11.77 as 136753 (3pp).

KANE ★ D25 77917B/43 ★J5 4117-421

N-(3-Oleyloxy-2-hydroxypropyl) amine derivs. - useful as nonionic surface activators, emulsifiers and dispersants

Granular product for washing and cleaning compsns. - contains alkali metal aluminosilicate and a highly polymerised phosphate

BENCKISER J A GMBH 01.04.77-DT-714604

*(16.10.79) *BE-865-572 C02b-01/44 C11d-03/12 +C01b-33/28 C11d-11*

An agglomerate compsn. is prepd. comprising a highly condensed polymer phosphate, and an ion-exchanging alkali metal aluminium silicate. The polymer phosphate has the formula $Me^{(I)}(n+2)PnO(3n+1)$ such that n is 4-50 and Me^{I} is an alkali metal cation or ammonium. The compsn. is prepd. in a by-weight ratio of polymer phosphates to silicate of 2:1-1:2.

Pref. the compsn. further comprises an amt. of sodium tripolyphosphate to obtain a mixt. contg. 5-100 wt% of polymer phosphate and 0-95 wt% of tripolyphosphate, such that the ratio of polymer phosphates to silicate is 2:1-1:2.

The compsn. is a non-caking and free-flowing granulated compsn. of high abrasion resistance. The compsn. is used as an additive to washing, rinsing and cleaning agents, as a water-softening agent and as a textile washing agent. 31.3.78 as 892209 (7pp931)

HENK D25 57909Y/33 =US 4171-278

Detergent for washing textiles at all temps. - contg. anionic nonionic and/or zwitter ionic tenside(s) and (acylated) hydroxyalkylamine (BE 4.8.77)

HENKEL KG AUF AKTIEN 11.11.76-OE-008373 (06.02.76-OE-000840)

*A97 E16 (16.10.79) *DT2703-020 C11d-01/44*

A surface-active cpd. combination is prepd. for use in textile washing agent compsn., and consists of ⩾1 tenside of the anionic sulphonate or sulphate type or non-ionic ethoxylated type, and ⩾1 hydroxyalkylamine cpd. such that the tenside is in wt. ratio to the hydroxyalkylamine of 100-1:1.

The hydroxylamine cpd. contains vicinal oxygen and nitrogen bridging atoms and is present as the ethoxylated/propoxylated deriv., the acylated deriv. or the ethoxylated/propoxylated acylated deriv.

The surface-active cpd. prepd. is used in the prepn. of low temp. detergents and low phosphate detergents. Good washing results may esp. be obtd. at 15-25°C. 2.11.78 as 941902 (+7.2.77, 5.4.77 - US - 766626, 784739) (+3.5.76 2.11.76 - OE - 003234, 008088) (17pp931)

CLOR- ★ D25 78992B/43 ★US 4171-280

Powder bleach contg. sodium percarbonate - prepd. by reacting sodium carbonate with hydrogen peroxide in fluidised bed

CLOROX CO 14.03.78-US-886662 (03.11.77-US-848216)

E34 (16.10.79) C11d-03/39 C11d-07/18

The compsn. is prepd. by spraying soda ash particles Na_2CO_3 with aq. H_2O_2 soln. at 35-70°C to produce a compsn. contg. enough Na percarbonate to provide 1-6 wt% available oxygen, the rest being Na_2CO_3.

The compsn. has better storage stability than mixtures of particulate Na carbonate and Na percarbonate and does not separate, as each particle contains regions of the two cpds. Na percarbonate dissolves rapidly and the available oxygen is quickly released. 14.3.78 as 886662 (9pp955)

UNIL D25 23321V/13 =US 4171-291

Alkane sulphonate prodn - by addition of bisulphite ion to alpha olefins in liquid medium gives product with surface active properties

LEVER BROTHERS CO 06.09.72-GB-041246

*E12 (16.10.79) *DT2344-421 C11d-01/14 +C11d-11/04*

Alkane sulphonates are prepd. by reacting an 8-20C olefin with bisulphite ions in a liq. medium in the presence of a substance initiating the reaction.

The process comprises forming a mixt. of olefin and a co-solvent contg. water and a 1-4C alcohol; and adding an aq. soln. of bisulphite to the mixt. to an excess of 0.1-0.2 mols of bisulphite ions per mol. of olefin; and adding sulphur dioxide to form bisulphite ions from the sulphite ions. In the initial mixt. the alcohol forms 58-70 wt% of the cosolvent and is present in amt. 50-100 wt% w.r.t. the olefin. After the bisulphite is added, the alcohol is present in amt. of 16-19 wt%; the bisulphite has a strength of ⩾90% of the satd value and contains ⩽ 14 mol% of sulphite ions w.r.t. bisulphite and sulphite combined.

The alkane sulphonates are pred. for use as a detergent active. Specific amts. of starting materials and specific reaction parameters give a high rate of reaction and high yield. 22.2.77 as 770547 (+31.8.71, 5.6.75, 5.5.76 - US - 393386, 583732, 683591) (2pp931)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240

Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

VENA- D11 42022U/30 =DS 2263-932
Thin dough strip - continuous prodn by rolling stretching laterally and stabilising
VER NAHRUNGSMITTELI (VER -) 04.01.72-OE-000042
*(25.10.79) *NL7300-102 A21c-03/02*

A plant to prepare strands of dough with a high gluten content, e.g. for the manufacture of strudel pastry, includes rolls to produce a strand of dough of greater thickness than is ultimately required, followed by a stretching operation at right angles to the direction of rolling. The pulled strand is held in the stretched width, pref. until its moisture content, has dropped to 17-20 wt.%. During this holding time (twice the stretching time) the dough can be heated and/or aerated. This prevents later contraction of the strand of dough and makes it suitable for continuous subsquent processing. 20.12.72 as 263932 (7pp39)

PILL D11 71633V/41 #DS 2325-948
Hydroprocessed wheat product - comprising wheat starch granules and homogeneous gluten protein particles
PILLSBURY CO 16.05.73-GB-023278 (22.05.73-DT-325948)
*(D13) (25.10.79) *GB1369-947 A21d-02*

A wheat prod. obtd. by water treatment comprises starch granules which are intact, ungelatinise and not surrounded by gluten protein; undenatured gluten protein in smoothly contoured particles which contain only a small amt. of the surrounded starch and opt. the total embryo and the total aleuron but no husk. The normal cell structure of the endosperm is practically completely broken up. The wheat prod. is excellent for making dough. 22.5.73 as 325948 (12pp068)

EISV- ★ D11 79190B/44 ★DS 2913-108
Dough raising cabinet air humidifier - using condensate collected and evaporated by electric steam generator
EISVOIGT VOIGTLANDE 02.04.79-DT-913108
(25.10.79) A21c-13

The air which is circulated in a dough raising cabinet to preserve and raise pastry dough is humidified by evaporation of water. The condensate, which drips off the cooler elements when the deposited rim thaws, is collected, partly evaporated by electric heating, and recycled to the circulating air.

This greatly simplified design needs no connection to a water main so that the appliance can be installed anywhere. Cleaning is only required at long intervals. 2.4.79 as 913108 (4pp39)

DANG- ★ D11 79249B/44 ★DT 2816-648
Filled wafer spreading machine - automatically controls filling layer thickness by counted number and weight
DANGER H KG 17.04.78-DT-816648
(25.10.79) A21c-15/02

A machine to spread a filling paste on pastry such as wafers counts the number of the arriving pieces and adjusts the spreading speed accordingly. The amount of the paste, spread over the wafers, is controlled in addition by the weight of the finished stack of wafers. The machine achieves uniform results in spite of the fluctuating flow rate to suit variations in the spped of the preceding bakery equipment.

Specifically a belt conveyor takes the wafers to a switch which can be set by a motor either to conveyor. Both run faster than the spreader so that the single wafers are pushed into a continuous strand. 17.4.78 as 816648 (12pp19)

LABA ★ D11 79337B/44 ★DT 2915-449
Film-forming lipoprotein complex for baking - is prepd. by reacting gliadin, opt. as gluten, with anionic lipid
LABATT J LTD 17.04.78-US-897283
(25.10.79) A21d-02/26 C07g-07

New lipoprotein complex, (I) contains gliadin, (II) reacted with an anionic lipid (III). A protein compsn. is claimed contg. (I) prepd. in situ by treating wet gluten with (III), esp. (I) prepd. in situ by (a) forming a wheat flour- or stirred dough in the presence of (III) and then (b) separating starch, fibre-contg. and soluble components. (III) may be Na dodecyl sulphate, a diacetyl tartrate of a fatty acid or a palmitoyl-1-aspartate of a fatty acid.

(I) can replace vital- and modified wheat gluten in baking. (I) does not coalesce in a dil. dispersion e.g. a 2% NaCl soln., but is dispersed in surroundings which are limited w.r.t. moisture, and can be mixed with natural wheat-proteins. (I) have improved absorption, film-formation (achieving film-forming index > 3) and body vol. properties. 17.4.79 as 915449 (48pp200)

ROYA- D11 16778Y/10 =GB 1554-916
Filling and closing machine for sponge sandwiches - aligns, positions, applies filling and closes halves together, without damage
ROYAL CAKE CO INC 22.08.75-US-606931
*+P62 Q31 Q35 (31.10.79) *DT2637-521 A21c-15*

Automatic sandwich cookie making machine has an upper and lower conveyor receiving via a divider plates equal numbers of top and bottom sections from a baking oven. A filling device deposits material onto cookie bottom sections travelling on the lower conveyor.

A deadplate positioned above the upper conveyor serves to collect and align the upper sections and these are advanced by a pusher plate onto the top of the lower sections covered with filling material. The consistancy and shape of the filling is selected to ensure that no further action is required to bond the cookie together.

The system provides a fully automated system esp. suitable for handling soft or crushable cookies. 20.8.76 as 034707 (6pp397)

D12: MEAT; FISH PROCESSING

WEIS/ D12 77401T/49 =DS 2123-350
Scalding/debristling machine - for pigs carcases with fixed trough and rocking roller assembly
WEISS A (WEI /) 11.05.71-DT-123350 (00.00.70-DT-061997)
*(25.10.79) *DT2123-350 A22b-05/08*

The Parent Patent describes a machine for scalding and removing bristles from pigs carcasses in a scalding water tank with two revolving bristle removing rolls. Method requires a tilting of the complete tank through a certain angle.

The novelty is that the tank remains stationary and the ends of the rolls are mounted in common crosspieces. The rolls which are driven by a common chain drive in the same direction are now reversed when the crosspieces are swung from one working position (left down, right up) to a second working position (left up, right down)

This requires less powerful drives and simplifies the design. There is now no risk of spilling hot water. 11.5.71

as 123350 Add to 2061997 (4pp39)

CENS D12 13338X/08 =DS 2532-309
Soya bean protein-based meat substitute - whose structure more closely resembles that of natural meat
CENTRAL SOYA CO INC 02.08.74-US-494099
*(25.10.79) *DT2532-309 A23j-03*

Meat substitute comprises longitudinally and compactly packed linseed or rape protein fibres, with the general appearance of sliced meat. Prepn. of these foodstuffs comprises extrusion of a defatted mixt. of linseed and rape plant materials (contg. ≥40% protein, based on the dried materials; and 30-60 wt.% water), at <100°C and under pressure.

The prods. pass through successive extrusion zones with reduction in temp. and pressure, to a final extrusion at <7kp/cm². 18. 7. 75 as 532309 (8pp047)

MUNC- D12 11937B/07 =DS 2744-456
Machine to cut open and clean stomach of chickens, etc. - comprises rotary carrier wheel with pockets contg. the stomach which is carried across the edge of a blade
MUNCHMEYER & CO 03.10.77-DT-744456
*(25.10.79) *BE-870-932 A22c-21*

A machine for slitting and cleaning out the stomachs of poultry consists of two discs, between which an eccentric disc forms a ring chamber of steadily reduced cross-section. Stomachs, charged into the wide part, are compressed when grooves take them to the narrower part where a circular blade enters the peripheral wall and slits them open. A herringbone-type of spreader opens out each slit stomach so that its contents can drop out. A revolving brush completes the cleaning operation.

The machine can deal with the stomachs of poultry of varying sizes and functions reliably without causing any over- or under-cutting. 3. 10. 77 as 744456 (6pp39)

NMHB ★ D12 79186B/44 ★DS 2832-259
Fish gutting machine - with pressurised water nozzle and revolving impeller of suction pump
NORDISCH MASCH R BAADER 22.07.78-DT-832259
(25.10.79) A22c-25/14

Fish gutter slits the central cavity and injects a liq. to break up the entrails. The gullet, small intestine and tendons securing the entrails are severed and extracted by pump suction.

Specifically a slitting blade which cuts open the fish on the conveyor is followed by a slotted nozzle where pressurised water is injected. A suction pump consists of a revolving rotor shaft with a radial-arm impeller and removes the entrails.

Appts. can deal with fish effectively even when they are ready for spawning or the entrails are difficult to dislodge (tunny fish). 22. 7. 78 as 832259 (4pp39)

SUPR- ★ D12 79241B/44 ★DT 2816-521
Oil and fat raw material processing - by distributing as film along inside walls of vertical heated cylinder
SUPRATON ZUCKER F J 17.04.78-DT-816521
(D23) (25.10.79) C11b-01/12

Raw materials with an oil and fat content, such as suet and other byproducts of abattoirs, are processed by reducing the size to under 15 x 15 mm and by feeding the paste to a vertical cylinder. This is surrounded on its shell by heating jackets, using steam or a liquid. Revolving scraper arms distribute the material in a uniform thin layer over the inside walls.

This processing method generates neither liquid wastes nor waste gases os that it does not pollute the environment. The product is treated gently so that the formation of fatty acids or perixide is eliminated. 17.4.78 as 816521 (10pp39)

WENZ/ ★ D12 79254B/44 ★DT 2816-865
Disintegrated blood albumin used as food prod. additive - is derived from slaughter animal chromo:protein and improves stability and juiciness
WENZEL S 18.04.78-DT-816865
(25.10.79) A22c-11 A231-01/30

Decomposed blood albumin, (I) derived from the chromoproteids of slaughter animals, is used as a food additive, esp. in meat article prodn.

(I) set to pH 5.4-6.6 (5.8-6.2) improves the taste, consistency or stability of foods, and esp. the juiciness o sausages. The emulsifying and water-absorption capacity of (I) is high. (I) may also be used in soup cubes, protein diets and in soup- and sauce-powders.

Quantity of (I), as dry solids w.r.t. roast material in sausage mfr. may be 0.2-5 (0.5-2.5) esp. 0.8-1.5 wt% (I) may be derived from blood by haemolysis at pH < 4, pptn. of globin protein acid adduct, separation from organic pptn. liq. and processing.

'Lyon sausage' charges contained 3.2 kg pork, 1.8 kg lard, 130 g nitrite, 12.5 g white pepper, 5 g nutmeg, 2.5g cardamon, 1 pinch cinnamon and 5 g sugar. The addn. of 250 g 10% (I) soln. or 25 g lyophilised (I) improved elastic consistency, pink-red colour, gloss of cutting surface, meat taste and juiciness. 18.4.78 as 816865 (16pp200)

MICR- ★ D12 79292B/44 ★DT 2856-821
Bacterial meat fermentation esp. to (semi) dry sausages - using mixt. of Micrococcus varians and lactic acid-generating bacteria
MICROLIFE TECHNICS 07.03.78-DT-856821 (06.09.77-US-830917)
(D16) (25.10.79) A22c-11 A23l-01/31

Dry and semi-dry sausage and other fermented meat prod. are prepd. by fermenting the meat with a compsn. contg. as active components, Micrococcus varians, (I), and >1 lactic acid-yielding bacterium, (II), to lower pH below 5.4 to >4.8.

The nitrate-reducing function of (I) is not inhibited. The sausage meat acquires a red, bright shade in the presence of edible nitrate and/or nitrate, without a surrounding 'grey ring'. Botulism toxin bacteria growth is inhibited. Use of (I) and (II) improves taste and aroma. 7.3.78 as 856821 Div.ex 2808759 (18pp200)

DORN- D12 42497B/23 =EP ---4-933
Band saw for meat and bones - with retractable holding plate for large pieces
MASCH DORNHAN GMBH 26.04.78-DT-818147
*+P54 P56 P62 (31.10.79) *DS2818-147 A22b-05/20 +A22c-17/02 B23d-55/04 B23q-01/02 B26d-01/46 B26d-07*
D/S: E(BE, CH, FR, GB, IT, LU, NL, SW).

A band saw for slicing meat and bones consists of a fixed support table through which a saw blade passes. Towards the rear, an adjustable portioning plate determines the desired slice thickness. A steady plate on the operator side can slide with its bar in a hinged guide bush. When the bush is swung back through 90°, the steady plate lies flush with the support table.

A safe support is provided for very large pieces of meat which can now be advanced by hand against the portioning plate without risk of injuries.

10.4.79 as 101101.(10pp39).

SWIF D12 73066A/41 =GB 1554-836
Poultry tendon extraction system - with first metatarsus bone breaking station and second shear application station
SWIFT & CO 28.03.77-US-782171
*(31.10.79) *DT2809-182 A22c-21*

Method of pulling tendons from the legs of poultry carcass is effected by carrying the carcass by its legs and breaking the lower legs without appreciably tearing the skin. Oppositely directed spaced shearing forces are applied across the break zone causing the skin to be severed together with the foot and for the tendons to be drawn from each upper leg of the carcass.

The system can be used on straight line conveyors and avoids the need for separate handling of the carcass. It is esp. suitable for use when processing turkeys. 6. 2. 78 as 004736 (7pp397)

MEYN/ D12 36956W/22 =NL-161-658
Automatic removal of poultry from transporter - from which the birds hang by the ankles in U shaped supports
MEYN P 15.11.73-NL-015638
*+Q35 (15.10.79) *NL7315-638 A22c-21*

Slaughtered fowl suspended by their ankle joints from carrying hooks attached to a moving conveyor are removed from the hooks by passing them through a U-turn in the conveying system in which the carrying hooks are restrained to hang vertically whilst an inclined guide rail placed below the carrying point causes the fowl to be lifted clear of the hooks and removed from the conveying system.

In order to ensure that the hooks are held in a rigid vertical stance during this operation, they are gripped between a wheel and a U formed guide, the wheel being equipped with teeth so that there is no possibility of the hooks moving either radially or tangentially relative to the wheel perimeter. 15.11.73 as 015638. (7pp1370)

UMEA= ★ D12 80375B/44 ★SU-646-972
Animals slaughtering installation - has feeding conveyors, profiled guides, plate like grippers and head-severing disc knife with electrical stunning rods
UKR MEAT DAIRY 03.08.77-SU-514804
(18.02.79) A22b-03/10

Device for slaughtering small animals by severing their heads, is similar to that of Parent Cert. No. 526335, which comprised a disc knife and two parallel chain conveyors with plate grippers to hold the animal in place. Now to ensure that first the animal is stunned the device is provided with two symmetrically-arranged drums, each of which is mounted above one of the conveyors in the space between its arms and have radially-distributed movable rods established so that they can be rotated by the conveyor. At the start of the grid base plate there are profiled guides for the animals.

Tkach, N.V., Vitrovchak, B.N., Zhmailo, B.P. Bul. 6/15.2.79. 3.8.77 as 514804 Add to 526335 (2pp29)

Fish processor with endless conveyor having fish troughs - and a feed section comprising conveyor belts forming a V/shape
NORDISCH MASCH R BAADER 13.08.76-US-714337 (31.08.76-SU-393335)
*(18.02.79) *US4084-294 A22c-25/06*

Device for conveying fish through a processing machine, consists of a conveyor with trays for the fish arranged transversely, plus two additional conveyors mounted as a pair so that a V-shaped gulley is formed between them. Driving rollers for these conveyors are placed at the inlet end and are set at an angle to the vertical. The variety of fish that can be processed is increased by disposing the paired conveyors between the arms of the tray conveyor, with the trays installed so that they can rotate through 90° to offload the fish into the gulley between the paired conveyors. The rollers at the exit end of the paired conveyors are axially parallel and on spring-loaded brackets fastened to rotatable guides, which can be parted. A measuring stop linked to the spring-loaded brackets is placed between the exit end rollers and can turn about the horizontal axis. Dorendorf, F. Bul. 6/15.2.79. 31.8.76 as 393335 (4pp29)

KOMP= ★ D12 80621B/44 ★SU-648-189
Artificial sausage skin production - by coagulating extruded collagen mass into tubular shape in salt solution maintained constant concentration
KOMPLEKS POULTRY IN 27.10.77-SU-538688
A97 (28.02.79) A22c-13

Device for the coagulation of collagen tubes during the production of artificial sausage skins comprises a bath with an overflow pipe, plus pipes inside to supply and withdraw the soln. and admit air, and a container for the soln., with a pump. Collagen tubes of constant diameter are obtd. by installing another smaller container in communication with the overflow pipe. This also contains pipes for admitting the soln. and allowing it to flow away, but is mounted above the overflow pipe on the bath. The end of the pipe which feeds in the solution is placed above the pipe through which the soln. flows out.

METZ/ ★ D12 80681B/44 ★US 4171-747
Sorter for live shrimps - with rotating disc and overlying gauging strip
METZGER S J 19.08.77-US-826172
P43 (23.10.79) B07c-09

Shrimps are size sorted in an appts. which comprises a housing with a rotatable shaft fixed to it. At least one disc is fixed to and rotates with the shaft. A gauging strip bifurcated at its terminal end into inner and outer branches is fixed to the housing and is positioned above and parallel to the upper surface of the disc inwardly of the disc perimeter. The strip defines a gauging gap between its lower edge and the surface of the disc.

An outer wall surrounds the disc but erminates prior to the bifurcated terminal end of the strip. The shrimps fall onto the disc inwardly of the gauging strip ahead of its bifurcated end. As the shaft rotates the shrimps are impelled towards the perimeter to be separated by the gauging gap. Two product chutes remove the sorted shrimp from the region of the disc.

The appts. can successfully sort live shrimp without damaging them so that undersized shrimps can be returned to the sea for further growth. 19.8.77 as 826172(23pp295)

DUCH/ ★ D13 79135B/44 ★BE-877-260
Non-digestible expanded perlite granules as pig feed additive - allows addition of vitamin(s) and oligo-elements, gives an improved carcass and allows excrement to form excellent manure (OE 15.5.79)
DUCHSTEIN S 27.06.78-OE-004659
C03 (15.10.79) A23k-01

Pig feed which is fed 'ad libitum' (on demand) contains a non-digestible, granular, porous additive comprising expanded Perlite granules having a size of 0-5mm (pref. 0-2mm). Generally the expanded Perlite additive comprises 10-50 vol. % of the feed. The feed may also contain physiological and/or medicament additives especially oligo-elements and vitamins.

The expanded Perlite is inert (has no toxic effects) whilst passing through the gastro-intestinal tract of the pigs and forms a suitable vehicle for introducing oligo-elements and vitamins. Addition of the Perlite allows the pig excrement to be formed into an excellent manure suitable for plant growth and avoids previous problems associated with pig excrement as a manure. The addition of the expanded Perlite to feeds for fattening pigs tends to give an improved carcass avoiding irrigation of flesh with blood at slaughter. 26. 6. 79 as 877260 (10pp395)

HUTI/ ★ D13 79483B/44 ★FR 2414-8

Mfr. and packaging of cream cheese in plastic pots - in whic fermentation takes place sealed off from ambient air

HUTIN B 04.01.78-FR-000167
A92 P13 Q31 (21.09.79) A01j-25 B65b-03/02 B65b-25/06

Mfr. and packaging a cream cheese takes place in a moul ed plastic, open-topped pot which is divided into two chan bers by an inserted partition, parallel to the base of the pot. The partition rests on internal ribs in the lower char ber and the two chambers are in communication via passa ges around the edge of the partition. The upper chamber larger than the lower chamber. A volume of milk greate than the vol. of the upper chamber and pre-seeded for fer mentation is filled into the pot which is then closed with a cover sealed to the edge of the pot.

The pot is inverted so that the milk falls into the large chamber. The pot remains in this position for a fermenta ion period of 9-20 hours at 16-21°C. The pot is returned its original, upright position so that whey drains into the lower, smaller chamber, leaving cream cheese in the up er chamber. The pots are pref. moulded from thermopla ic sheet on a prodn. line on which the complete process i carried out.

Enhanced hygience is obtd. during curds drainage peri The curds do not contact ambient air during the fermentat ion period. High output at low cost with excellent taste an texture of prod., and other advantages. 4. 1. 78 as 000167 (14pp448)

ALIM- ★ D13 79484B/44 ★FR 2414-8

Multi-compartment curds vat for producing cheese - has end pla flap valve to improve utilisation

PROD ALIMENTAIR DIE 20.01.78-FR-001615
P13 (21.09.79) A01j-25

Vat takes the form of an open-topped channel, pref. of semi-circular cross-section. Spaced partitions can be lo ered into the vat to subdivide it longitudinally into a numb of compartments, all of equal vol.

One fixed end-wall of the vat has a discharge port thro gh which the contents of each compartment in turn can be transferred to the moulding line. The port is now fitted with a pivoted flap valve which, when closed, completed the enclosure of a correct vol. compartment adjacent the end wall.

The valve enables the length of the vat to be fully utili ed. It is of great assistance during cutting washing, clea ing etc. 20. 1. 78 as 001615 (10pp448)

LEPR- D13 16154A/09 =GB 1554-954

Pizza cheese mfr. - with added injection of specified culture to reduce lactose content and improve stringy characteristics (NL 21.2.78)

LEPRINO CHEESE MFG 18.08.76-US-715577
*(31.10.79) *DT2650-984 A23c-19/02*

Pizza cheese is mfd. by inoculating a batch of pasteurised cow's milk with an effective pizza cheese-making amt. of a starter culture.

The starter culture comprises Streptococcus thermophilus together with Lactobacillus bulgaricus and/or L. helvetius, and with 0.5-3.0 wt.% of an additional viable culture of Pediococcus cerevisiae, L. plantarum, S. faecalis, S. durans and L. casei. A cheese curd is made from the inoculated milk, which is mixed and stretched in water at $>$ 130°F to impart a stringy texture to the cheese. The stretched curd is moulded into cheese bodies, which are salted and held at a non-freezing temp. $<$ 55°F for $\geqslant$5 days to reduce the residual lactose sugar content of the cheese.

Part-skim low-moisture Mozzarella pizza cheese is mfd. which slices or shreds readily, which can be handled and applied to the pizza. 3.11.76 as 045756 (15pp931)

Frozen animal and human food prod. - contg. a salt and the reduced water content for rehydration before use

MARS LTD 22.01.79-GB-002156 (24.04.78-GB-016158)
C03 (31.10.79) A23b-04 A23l

Frozen food prod. comprises a frozen-foodstuff(s) having a moisture content below the level required when ready for consumption. The prod. contains frozen and unfrozen water and a water-soluble salt(s) (I) at sufficient concn. (but $<$4% for any individual salt and $<$10% for all salts).

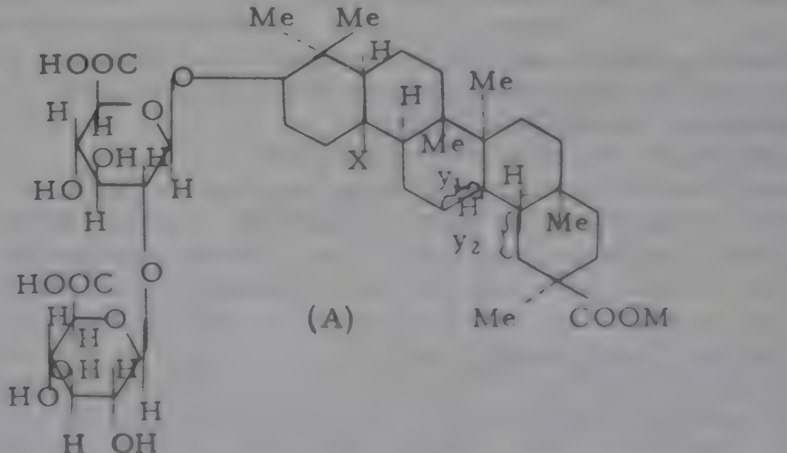
Prods. are readily penetrable by thawing water and can be quickly brought into condition for consumption with acceptable or advantageous organoleptic properties, esp. by addn. of warm or hot water to restore the moisture contents to its normal value while the prod. reaches the normal temp. for consumption. Typical prods. are animal foods and human convenience foods. 22.1.79 as 002156 (7pp1248)

YAMS ★ D13 79572B/44 ★GB 2019-407

Periandrin I,II,III and IV from Periandra roots - useful as natural sweetening agents

YAMASA SHOYU KK 02.03.79-JA-023413 (14.04.78-JA-043198)
B03 E13 (31.10.79) C07j-63

Periandrins I, II, III and IV and their salts of formula (A) are new.



(A)

In (A) M is H or a cation; X is CHO or CH_2OH; one of y_1 and y_2 is a double bond and the other is a single bond as shown.

Cpds. (A) have a sweet taste that is refreshing and delicate; their sweetness is comparable with that of glycyrrhizin but with little or no bitter taste.

Specifically claimed are periandrins I, II, III and IV, i.e. where X =CHO and y_2 and y_1 is a double bond and where X = CH_2OH and y_2 and y_1 is a double bond, respectively; and their alkali metal, Ca and NH_4 salts. 9.4.79 as 012336 (15pp1244)

CANP ★ D13 79573B/44 ★GB 2019-409
Solid, high protein dietary food prods. - contg. gelatin hydrolysate, essential aminoacids, and digestible additives
CANADA PACKERS LTD 21.04.78-US-898994
(31.10.79) C07g-07

Solid, high protein dietary food prod. consists of a gelatin hydrolysate (I), essential amino-acids (II), and digestible additives (III). (I) consists mainly of high mol. wt. polypeptides, and is solid at room temp. Suitable (III) include preservatives, flavouring and colouring agents, texturisers, and sweeteners.

The high protein food prod. contg. (I) is solid at room temp. without contg. any non-nutritive carriers, may be directly ingested or incorporated into other food prods., and is much more palatable than conventional liq. high protein compsns. The prods. may be used e.g. for anorexic patients. 17.4.79 as 013351 (5pp478)

GUSH/ ★ D13 79856B/44 ★J5 4122-300
Stevioside prodn. from Stevia rebaudiana bert. plant - by extn. with hot water, addn. of aluminium ions and then barium ions with filtration of ppte., and adjustment of pH
GUSHIKEN T 14.03.78-JA-028886
B03 E13 (21.09.79) A23l-01/22 C07h-01/08 C07h-15/24

Stevioside (I) is extracted by treating a plant body of Stevia rebaudiana Bert. with hot water, filtering the extract, adding Al ions, such as K alum or Al-sulphate filtering the ppte, adding Ba ions, such as Ba hydroxide, to the filtrate, filtering the ppte, and adjusting the pH of the filtrate.

(I) which is 300 times as sweet as sucrose, is obtd. industrially and economically in high yield. 14.3.78. as 028886 (2pp104)

KANF ★ D13 79979B/44 ★J5 4122-762
Re-structured fibrous food prodn. - by mixing wheat protein with polysaccharide, adding edible salt, protein-unfolding agent and enzyme and kneading
KANEGAFUCHI CHEM KK 13.03.78-JA-028816
(22.09.79) A23j-03 A23l-01/32

The fibrous food is obtd. by (a) mixing the protein compsn. of wheat protein with 40-400 w/w% on the protein solid of high molecular polysaccharide, (b) adding edible salt, protein-unfolding agent and the decomposing enzyme for glucoside bond, (c) kneading the mixt., (d) spreading or stretching thus obtd. mixt. for fibre-forming and (e) if necessary, heat-treating thus obtd. fibrous food at 75-122°C for completing the fibre-formation.

The fibrous food is useful as snack food, dainty food and meat-like food. The unfolding of protein and the decomposition of polysaccharide proceed simultaneously and the fibre-formation can be promoted. Thus excellent fibrous food can be obtd. without spinning process. 13.3.78. as 028816 (4pp5)

Determn. of fermentation degree of cocoa beans - by extraction with methanol-hydrochloric acid mix, and spectrophotometric analysis

GUSEVA K B 05.08.77-SU-516658

R16 (08.02.79) G01n-33/02

The fermentation degree of cocoa beans can be determined by estimating the ratio of the coloured substances contained in the beans.

The accuracy of this determination can be increased by preliminarily treating the cocoa beans with a 97:3 mixt. of CH$_3$OH and HCl at 5-10°C for 20-24 hr.

The optical density of coloured materials in the resulting extract is determined at the 460 and 530 mμ wavelengths. When the cocoa beans are fully fermented, the density ratio is $D_{460}:D_{530} \geqslant 1$.

Tomato paste mfr. - by adding sugar to pulp before evaporation, when using tomatoes with reduced soluble solids content

YASTREBOV S M 01.08.77-SU-512032

(18.02.79) A23l-01/06

Tomato paste is produced by washing, inspecting, crushing, warming, triturating and evaporating. To improve product quality when using tomatoes with a reduced soluble solids content, sugar is added to the pulp before evaporating in an amt. of 0.1-1.0%.

Raising the ratio of soluble to insoluble solids two-fold reduces the product viscosity 6-fold, and this permits production of paste containing 30% dry solids or more, and of better quality, without burning.

*P13 Q31 (15.10.79) *FR2176-728 B65b-55/04*

Beakers are filled with a material for consumption under sterile conditions. The beakers are fed onto an endless belt which is housed in a sterile chamber. The space within the belt is divided by upper and lower plates into upper and lower zones. In the upper zone, the beakers are filled, lids are placed onto them and they are removed from the belt.

At the end of the upper belt travel, the fresh beakers are placed on the belt from where they then pass through a spray zone so that they can be treated with a sterilising fluid and the lower zone is used for drying them. This is achieved by passing the inverted beakers over a spray plate through which dry sterile warm air is blown.

Enclosing the entire belt in a sterile chamber eliminates the need to enclose the beakers individually in sterile chambers and hence renders the entire installation both simpler and more economic. 8.3.73 as 003265. (6pp1370)

Modular cryogenic freezing tunnel - with stationary cover and vertically movable base operated by hydraulic elevators
FORMAX INC 02.11.77-US-847721
Q75 (23.10.79) F25d-17/02 F25d-25/04

A cryogenic food freezing tunnel comprises an elongate tunnel housing with a conveyor extending through it. Cryogen is introduced into the tunnel near the food product exit end and is exhausted from the tunnel near the food product inlet end.

The tunnel is formed with a stationary cover and a base of U-shaped section which is suspended from the cover. The base can move between an elevated operational position and a lowered service position. The housing includes modular base units aligned end-to-end and comprising $\geqslant 1$ centre unit interposed between two end units.

Each unit may be separately raised and lowered. There are guides for the end units for guiding each of those downwards and outwards on lowering. The base units are raised and lowered in a predetermined sequence such that the end units are lowered before the centre unit, and on raising a reverse sequence is followed.

The tunnel is used for rapid freezing of food products such as hamburgers, steaks, chicken pieces or patties or fish. Sealing problems are minimised by continuously holding the tunnel base units in a sealed position against the cover through the application of pressure by the elevators with no mechanical latches. 2.11.77 as 847721 (22pp295)

Purificn. of waste water with intermittently immersed bacteria beds - in controlled atmos. in pressure vessel contg. rotary cylinder
STENGELIN V 26.06.78-DT-827996
(15.10.79) C02c

Installation for the biological purification of waste water is of the type comprising a rotary cylinder, pref. of plastic, carrying beds of bacteria which are alternately immersed in and raised clear of the water by rotation of the cylinder. Purificn. includes elimination of organic carbon, the oxidation of ammonia to convert it into nitrates and the denitrification of nitrates to produce nitrogen gas.

Improvement is that the rotary cylinder is housed in a pressure vessel. The cylinder comprises a number of bacterial bed plates spaced axially, side-by-side. The cylinder supports and the drive transmission are pref. positioned above the max. level of water inside the vessel The water level within the vessel is adjustable.

Used for biological purificn. of waste water atmos. within the vessel headspace can be controlled for optimum efficiency of the bacterial beds, e.g. waste water with heavy organic pollution may require an atmos. of nitrogen and oxygen in which the proportion of oxygen is more than 60% during nitrification, the beds can turn in an atmos. free from oxygen. Circumferential support and drive to the cylinder can remain always above water level with elimination of operational problems associated with fouling 25.6.79 as 877249 (17pp448)

Delignification and bleaching system for pulp mfr. - prevents chloride build/up in the recovery system for the digestion chemicals (SW 3.5.76)
MANNBRO N V 08.10.74-SW-012638
F09 (16.10.79) D21c-03 D21c-11

Method of reducing chloride accumulation and water pollution in the mfr. of bleached pulp from lignocellulosic raw material, is claimed. The raw material is delignified with non-chlorine agents to form a spent liquor and unbleached stack. The stock is then bleached with a chlorine cpd. to form a bleached stock and chlorine-contg. belaching effluent. This bleaching effluent is applied to unbleached stock for displacement of the remaining spent liquor.

The improvement is that the major portion of the spent liquor and the spent liquor resulting from displacement is removed and combined. This lye is subjected to recovery processes for removal of useful materials. The unbleached stock is then displacement washed with bleaching effluent to form a brine having a higher concn. of chlorine cpds. than the lye. The brine is then passed to a separate treatment system comprising a step for thermally oxidising organic substances to such a degree that the chlorine cpds. are converted to chloride and any sulphur cpd. are converted to at least oxidn. number IV.

The method prevents the build-up of chloride in the recovery system for the digestion chemicals used in the pulping process. 6.10.75 as 237121 (37pp1307)

Clarification plant run/off gutter cleaning - by twin brush carrier adjustable in height and spread
BORMET H 21.04.78-DT-817527
(25.10.79) C02c-01/26

The run-off gutters from biological sewage treatment plant are kept free from algae by a brush carrier with two revolving brushes on vertical shafts which can swivel on a vertical column. A jib for the brush carrier can move in the vertical and horizontal plant on a guide bar on a clearance bridge.

This is a simple design which can be produced at low cost, yet has adequate facilities for adaption to any changing conditions. 21.4.78 as 817527 (13pp39)

OSAG ★ D15 79282B/44 ★DT 2821-054
Activated sludge treatment of sewage - in one open and two closed stages with specified oxygen concn. for oxidation and flocculation
OSAKA GAS KK 15.04.78-JA-044708
(25.10.79) C02c-01/06

An activated sludge process for the treatment of municipla sewage and industrial wastes applies jet grindling to the sludge in the effluent, containing the biochemical oxygen demand (BOD) component, to such an extent that the cells of the microorganisms are not destroyed and the BOD component is absorbed on the ground sludge. This component is oxidised by aeration and flocculation.

This reduces the amount of surplus sludge produced (which has to be disposed) to a minimum. There is no risk of explosion in closed vessels and a high efficiency is maintained. Gas with a low oxygen concentration and air can be used so that the operation costs are low. 13. 5. 78 as 821054 (25pp39)

HOTA- ★ D15 79396B/44 ★EP ---4-934
Appts. for biological purification of waste water - with generated auxiliary currents to prevent blockage of sedimentation chamber exit
HOTACO AS 13.04.78-DK-001618
(31.10.79) C02c-01/06
D/S: E(BE, CH, DT, FR, GB,IT, LU, NL, SW).

An appts. for the purification of waste water includes an aeration chamber where the waste water is mixed with an activated sludge and is aerated by immersed diffusers. The appts. also includes a secondary sedimentation chamber in which the sludge is precipitated and from which the purified water is removed via an overflow.

The sedimentation chamber is formed as an upwardly open plate insert positioned in the aeration tank. The insert has bottom and side walls inclined downwardly towards a bottom opening. A central channel is defined within the insert between two vertical, parallel plates extending between the end plates of the insert, and from their upper edges to a point above the bottom opening. The central channel is connected to the aeration chamber through tubes.

The bottom opening of the sedimentation chamber tends not to become blocked as would be the case without the use of the central channel which produces auxilliary currents to sweep accumulated sludge from the inclined walls of the insert down through the bottom opening back to the aeration chamber.

Controller for water softener with brine regeneration - activated after treatment of specified volume of water
WATER REFINING CO 14.04.78-US-896568
R26 R27 (31.10.79) C02b-01/40 G05d-21/02 G06f-15/46
D/S: E(DT, FR, GB).

A water treatment system includes a brine tank which is used to regenerate the resin bed. A computer controller is connected to a sensor which records the volume of water treated by the apparatus. The computer has a manual entry via which variable data can be specified.

When the plant has processed a specified volume of water the computer operates valves to initiate a regeneration cycle the duration of which is also controlled by the computer. Preferably the computer has additional inputs which detect a low liquid level in the brine tank and extend the regeneration cycle accordingly.

The appts. softens water.

The computer controller provides for a more precise control of the operation of the softener than is possible with a simple controller which typically initiates a regeneration cycle at regular time intervals.

Flocculation and removal of suspended negatively charged solid by adding of positively charged particles, then using gravit electrostatic, or magnetic sepn. technique
IMPERIAL CHEM INDS LTD 23.03.79-GB-010264 (20.04.78-G 015655)
J01 (D16) (31.10.79) C02b-01/20

Inorganic or organic matter suspended in a liq. and havi a net negative charge is removed by adding a particulate material having a net positive charge, so that the suspended matter flocculates around and adheres to the particles, which are then removed from the liquid. The process is applicable to e. g. removal of microorganisms, waste water solids, insolubilised enzymes, xanthan gums, single cell protein etc. from suspension.

The flocs may be sepd. by settling, or if the particles are ferromagnetic, by magnetic or electrostatic means. The particles are e. g. sand or magnetite if magnetic sepn. is desired. If the particles have a negative charge, this may be changed to a positive one by treatment with a soln. of a divalent or trivalent metal salt at a suitable pH., e. g. $FeCl_3$ or alum. A polyelectrolyte may also be used. 23. 3. 79 as 010264 (4pp955)

Treating waste water contg. pollutants and inorganic nitrate(s) - by electrochemical reaction and flotation

NIPPON OILS & FATS KK 11.03.78-JA-028092

J03 (19.09.79) C02c-05/12

Waste water contg. pollutants and inorganic nitrate(s), e. g. ammonium nitrate, $NaNO_3$, KNO_3 and $Ca(NO_3)_2$ etc. is purified to remove the pollutants by electrochemical reaction and flotation by first immersing Al(alloy) anode plate and cathodeplate opt. of a different metal in the waste water.

Direct current is then passed between the electrodes to cause electrochemical reaction between the inorganic nitrate and the metal electrodes to a gel-like Al hydroxide on which the pollutants are adsorbed. The pollutants-adsorbed gel-like Al hydroxide rises by flotation-coagulation to the surface of the water by the action of electrolysed gas by-produced in the electrochemical reaction.

When the inorganic nitrate(s) is not contained in the waste water to be treated, it must be added prior to the treatment. By this process, all colloidal Al rises to the surface of the water to leave clarified water. 11. 3. 78. as 028092 (5pp34)

Purificn. of waste liquor in fluorine-adsorption treatment - by adding calcium salt, sedimentation, treating with alkali, contacting with adsorbing agent and repeating
HITACHI PLANT ENG CONST 15.03.78-JA-030405
(20.09.79) C02c-05/02

The waste liquor is treated to remove economically, therefrom fluorine in high efficiency without any special appts. by adding a Ca salt, e.g. $Ca(OH)_2$ and $CaCl_2$ etc. to form a ppte followed by solid liquid sepn., e.g.by sedimentation, adjusting the pH value of the supernatant liquor to $>$10.5 with pH-adjusting agent, e.g. NaOH etc., contacting the pH-adjusted supernatant liquor with a fluorine-adsorbing agent which can be regenerated, e.g. alum etc., carrying-out the regeneration of the adsorbing agent when it is satd. with fluorine, adding the regenerating waste liquor to the former fluorine-contg. waste liquor to be treated, and repeating the adsorption and regeneration treatments with the regenerated adsorbing agent.

Process is used in regenerating waste liquor in fluorine content, esp. from regenerating fluorine-adsorbed activated alumina or ion exchange resin with alum, H_2SO_4 or HCl etc. 15.3.78. as 030405 (3pp34)

KUBI ★ D15 79781B/44 ★ J5 4121-564
Appts. for denitrifying waste water - comprises pH adjusting vessel, oxidising vessel using activated sludge and reducing vessel using activated sludge and organic carbon source
KUBOTA KK 14.03.78-JA-030216
(20.09.79) C02c-01/06

The appts. comprises a pH-adjusting vessel in which the waste water is made weakly alkaline, an oxidising vessel in which the pH-adjusted waste water is oxidised with activated sludge, a reducing vessel wherein the treated water is reduced with activated sludge in the presence of org. carbon source, a means for separating the activated sludge from the water thus treated, a path supplying the reduction-treated water from the reducing vessel to the pH-adjusting vessel, and a means for recirculating a sludge obtained in the separating vessel to the reducing vessel as the org. carbon source.

The denitrified water exhibits very high alkalinity, thereby it is used as the alkali in the pH-adjustment; and the activated sludge is used as the org. carbon source.

ASAG ★ D15 79917B/44 ★J5 4122-616
Collecting uranium from e.g. sea-water - includes using high molecular absorber, made of a fluoro-polymer with phosphorus in the ion exchange radical
ASAHI GLASS KK 17.03.78-JA-029816
A91 K05 M25 (22.09.79) B01d-15 C22b-60/02

Uranium is recovered from sea water or from a soln. containing U-100 ppm by using a high molecular absorber and is characterised in that the high molecular absorber is made of a fluoro polymer having P in the ion exchanger radical such as a phosphonic acid radical (gp.), phosphinic acid radical, mono ester phosphate or similar ion exchange radical, or is made of polystyrene type copolymer with a F contg. phosphate ester radical. The density of the P contg. ion exchange radical in the high molecular cpd. $>$ 0.2 mm equivalent/1 g(high molecular compound).

The high molecular cpd. may be obtd. by reacting a fluoro polymer with H_3PO_3 or dialkyl phosphorous ester $[HP(O)(OR)_2]$ or by linking a polystyrene type copolymer with divinyl benzene. The U absorber may be shaped as porous pellets. 17.3.78. as 029816 (5pp135)

TOYM ★ D15 79943B/44 ★J5 4122-678
Hollow thread type membrane sepn. appts. - comprises cylindrical vessel contg. columnar hollow thread part, with resin walls at one end of thread layer

J01 (22.09.79) B01d-13 B01d-53/22 C02b-01/82 C02c-05/02

The membrane sepn. appts. comprises a cylindrical vessel contg. a columnar hollow thread assembly part. This comprises a hollow thread layer made of a lot of hollow threads of selective permeability to a fluid, and resin walls which are located at one end of the hollow thread layer. The hollow thread in the hollow thread layer penetrates $\geqslant 1$ of resin walls and has its opening outside the wall. A pressure receptor plate with $\geqslant 1$ surface filled with linear protuberances, is provided, so that the top of the protuberance contacts the opening of the hollow thread.

An improved sepn. method is provided using a membrane of selective permeability. 15.3.78. as 030165 (5pp55)

KURK ★ D15 80076B/44 ★J5 4123-243
Chloride removal from water - by contacting with a supported catalyst comprising a cobalt and/or nickel salt
KURITA WATER IND KK 16.02.78-JA-015936
E36 (25.09.79) B01j-23/74 C02b-01/23

Chlorine is effectively removed from water by contacting the water with a catalyst prepd. by contacting a carrier, e.g. zeolite and alumina etc. with an aq. soln. of Co and/or Ni salt, e.g. $CoCl_3$, $NiCl_2$, $Co(NO_3)_3$, $Ni(NO_3)_2$, $Co_2(SO_4)_3$ and $NiSO_4$ etc. under an ordinary temp. and pressure; opt. washing the Co- and /or Ni-ion-adsorbed carrier with water so as to remove Co- and/or Ni-ion only at the activated points of the carrier; and subsequently contacting the carrier thus treated with aq. alkali soln. of chlorinating agent, e.g. NaClO, Cl_2 etc.

In a modification, the carrier washed with water may first be heated to convert the Ni- and/or Co-ion into corresponding oxide(s) prior to contacting with the aq. alkali soln. of the chlorinating agent. The alkali to be used with the chlorinating agents are, e.g. NaOH and KOH etc. 16.2.78. as 015936 (4pp34)

HITB ★ D15 80077B/44 ★J5 4123-247
Treatment of raw sewage and derived sludge - by (an)aerobic treatment with coagulation dewatering of sludge using cationic coagulant, then mixing and activated sludeg treatment
HITACHI CHEMICAL KK 16.03.78-JA-030267
(25.09.79) C02c-01/02 C02c-03

In treatment of raw night soil and a sludge resulting in night soil-purifying and-storage vessel, the improvement comprising subjecting the raw night soil to an aerobic or anaerobic treatment, whilst subjecting the sludge to a coagulation dewatering treatment by the use of a cationic coagulant, blending together each of the treated liquors, and subsequently subjecting the mixt. to an activated sludge treatment, so that load in the (an)aerobic raw night soil treatment is decreased and stabilised, and at the same time the sludge is dewatered and dried.

A treated water is obtd. having BOD concn. of $<$.500 ppm and BOD removability of $>$ 90% by subjecting only the sludge to the coagulation dewatering treatment, and therefore the treated water is easily purified by a secondary treatment. The dewatered and dried sludge is available for use as soil-improving agent. 16.3.78. as 030267 (3pp34)

MATU ★ D15 80078B/44 ★J5 4123-249
Treating COD components in effluent - e.g. tartaric acid, citric acid, malic acid, etc., by contacting with ferric oxide, opt. with stirring
MATSUSHITA ELEC IND KK 17.03.78-JA-031378
(25.09.79) C02c-05/02

Organic COD components in effluent are economically decreased, in a simple manner, by contacting the effluent with Fe_2O_3, opt. under stirring.

Rust formed on the surface of scrap iron exhibits the same effect, so that the COD components can be removed by simply charging scrap iron into an aeration vessel for effluent treatment, giving little pressure loss and blinding. 17.3.78. as 031378 (3pp34)

HOSO ★ D15 80079B/44 ★J5 4123-250
Calcium-contg. water-treating agent prepn. - by mixing calcium cpd. and aluminium cpd. and calcining, used e.g. for treating effluent contg. soluble polymers
HOKKAIDO SODA LTD (SUMI- AGEM) 18.03.78-JA-031408
A35 F09 (25.09.79) C02c-05/02

The treating agent is prepd. by uniformly mixing together a Ca cpd. capable of forming CaO by calcination, e.g. $Ca(OH)_2$, $CaCO_3$ and $CaCl_2$ etc. and an Al cpd. capable of forming Al_2O_3 by calcination , e.g. $Al(OH)_3$, $AlCl_3$ $Al(NO_3)_3$ and $Al_2(SO_4)_3$ etc. in such amts. that the wt. ratio between CaO and Al_2O_3 becomes 40/60 to 85/15 pref. 70/30 to 80/20, after calcination, and subsequently calcining the mixt. at 1200 to 1600°C, pref. 1200 to 1400° C, for 30 min. to one hr.

The agent exhibits excellent adsorbability against water-soluble polymer cpds. difficult to be removed, esp. starch and PVA etc. It is suitable for use in the treatment of effluents contg. water-soluble polymer cpds. e.g. PVA starch, CMC etc., emulsified effluents from suspension polymerisation of synthetic polymers and pulp mill effluents, etc. 18.3.78. as 031408 (5pp34)

Desorption of uranium from titanic acid adsorbent - using carbonic acid alkaline soln., in the extn. of uranium from sea-water

KINZOKU KOGYO JIGYO 16.03.78-JA-029237
E31 K05 M25 (26.09.79) C01g-43 G21f-09/12

In the desorption of uranium from a uranium adsorbent of titanic acid which adsorbs uranium contained in sea water, a carbonic acid alkaline soln. is used, as the desorbent, having a carbonic acid radical concn. of 0.4 mol/l and a quantity index $M_1/(W_2/22.2)$ of 1-30 when M_1 is the mol. number of carbonic radicals and W_2 is the dry weight of titanic acid. It is possible to effectively desorb uranium from a uranium absorbent.

Typically, a titanic acid absorbent has a mean particle dia. of 0.25-0.5 mm and is packed into a column 3 cm in dia. Sea water at 27°C is passed through the column at a flow rate of 100 ml/min. for 7 days to adsorb the uranium. The adsorbent is washed with water and removed from the column. The absorbent is mixed with 30 ml of a desorption soln. contg. 1 mol/l of sodium hydrogencarbonate. The mixt. is shaken at 50°C for 7 hours. The uranium elution rate is 96% and the uranium concn. in the soln. is 14.4 ppm. 16.3.78. as 029237 (5pp86)

(18.02.79) B01f-05/04 C02c-01/10

Device for aerating liquids, e.g. the saturation of effluents, comprises a water-conducting pipe in which is an aeration tube with a cone at its upper end, above which an air-intake tube with a conical attachment is located. A stable aeration effect, during variation in liquid flow-rate, is established by positioning the air-intake tube so that it is capable of being moved vertically.

The liquid to be aerated rises up the outer tube under the effect of a pump or other pressure applicator, travelling between the outer tube and the inner aeration tube mounted coaxially. The water rises to a level which ensures that it flows over through the slit formed by the cone and the conical attachments of the two parts. A funnel of water is formed with a known degree of conicity-corresponding to the conicity of the slit-like water-overflow. The water takes in air intensively, the volume of which increases as the conicity of the water funnel decreases, with simultaneous increase in the liquid flow-rate.

Liquid fertiliser - based on waste water of fodder yeast cultivation using alkane(s) as nutrient
AS AGROCHEM SOIL (ASBI=) 30.12.75-SU-199953
C04 H04 (D16) :(18.02.79) C05f-07

Liquid agricultural fertiliser comprises the waste water from feed yeast biomass prod. plant utilising petroleum source n-alkanes as nutrients.

The above fertiliser can be used all year round. It contains no toxic materials or parasites and includes growth stimulating components with high vitamin, aminoacid, nucleotide etc. content. The alkanes which may be present can be easily decomposed by soil bacteria improving the plant nutrient value of the fertiliser.

The use of above waste waters as fertiliser improves the crop yield and reduces the cost of biomass prodn. as effluent purificn. is not required.

Filtering centrifuge for industrial and agricultural effluents - uses hydraulic cyclone as inlet nozzle to filter liquid phase through sediments from thickened suspension
MOLD COLLECT FARMS 03.11.77-SU-540148
J01 P41 (27.02.79) B04b-03

Improved quality of sen. by filtering centrifuge for clarifying effluent water from stock breeding establishments as well as from food, chemical, and other industrial plants, is ensured by reduced carrying of solid particles by the filter liquor. The initial material is fed into the horizontal rotor of the centrifuge through the hydraulic cyclone which separates the liquid phase from the thickned suspension. The latter is fed to the filtering drum in advance of the liquid phase which is therefore filtered through a sediment already precipitated on the drum. The top surface of the sediment removed by a knife falls into the screw conveyor, to be discharged from the centrifuge.

Soluble gas and liquid contact exchange process - esp. for deuterium concentration using sea-water and hydrogen sulphide with gas recirculated by flash pressure reduction
DEUTERIUM CORP 13.02.76-US-658060 (22.03.71-US-126498)
E36 J01 K05 (23.10.79) C01b-05/02

In a gas-liquid contact process, using a partially soluble gas, part of the liquid is extracted after passage through a high pressure hot contact zone. The pressure of the extracted liquid is flash-reduced to remove some of the dissolved gas. The gas removed is returned to the process by absorption in initial liquid feed.

The process may be used for hydrogen isotope (denterium) concentration using hydrogen sulphide gas and water. Higher efficiency is achieved at relatively low temps. A distilled liquid by-product is formed free of solubles, e.g. salts in sea-water. 13. 2. 76 as 658060 Div. ex 3984518 (c. f. 79261 X/42)(+ 17. 7. 74 - US - 489449)(8pp1312)

Phlogistic substance for testing antiphlogistic drugs - comprises dissolved substance from fungus cell wall obtd. by removing water-soluble fraction from self-digested beer yeast

EBIOS YAKUHIN KOGYO 15.03.78-JA-029412

B04 (22.09.79) A61k-35/72 C12d-07

Plogistic substance comprises dissolved substance from fungus cell wall obtd. by removing water soluble extract fraction from self-digestive substance of beer yeast.

The substance has phlogenic action such as pyrogenic oedema-forming action and is useful for evaluating antiphlogistic drug on pyretolysis action and oedema-inhibiting action.

In an example, bitter taste-eliminating-cleaning agent is added to beer yeast such as Saccharomyces carlsbergensis and hops, followed by washing with water repeatedly to purify. The resultant aq. suspension of yeast was subjected to self-digestion at suitable temp. e.g. 45-55°C usually for 18-24 hours, in some cases for 2-3 dyas. Then, resultant self-digested substance was subjected to centrifugal separation or filtration to remove water-soluble extraction fraction, resultant fungi body residue was treated with kitalase to dissolve of cell wall of fungi body. Complete dissolving is not necessary but completion by dissolved substance is preferable. The prod. was spray-dried and the resulting powder was suspended in water. 15.3.78. as 029412 (5pp69)

Extracting glucose-isomerase from microbial body - using high pressure homogenising process

MITSUBISHI CHEM IND KK 15.03.78-JA-029416

(22.09.79) C07g-07/02 C12d-13/10

The method is characterised by releasing glucoseisomerase from the glucoseisomerase-producing microbe belonging to Actinoplanes by treating the microbial body in a high pressure homogenising process.

Actinoplanes missouriensis NRRL B 3342 contains highly active glucoseisomerase but the glucoseisomerase cannot be extracted efficiently by conventional methods such as autolysis method, lysozyme method, etc. The high pressure homogenising process can be practiced as follows. (1) the microbial slurry is press-fed into a homogeniser under a pressure of 10-800 (350-750)kg/cm^2 and the slurry is introduced into the low pressure zone (pref. into the normal pressure zone) suddenly from th high pressure zone. (2) In the low pressure zone the microbial body is collided against a collision ring. The homogenising process is usually repeated 1-10 (1-4) times and ca. 90% of glucoseisomerase can be extracte The method can be adapted for microbes such as Actinoplanes philippinensis, A. missouriensis and A. armen cus. 15.3.78. as 029416 (7pp5)

Glutathione prodn. - by treating L-glutamic acid, L-cysteine glycine with glutathione synthetase-contg. material

TANABE SEIYAKU KK 10.03.78-JA-028008

A96 B05 (22.09.79) C12d-13

In the prodn. of glutathione by treating L-glutamic aci L-cysteine and glycine with glutathione-synthetase-con substance, the reaction is carried out in the presence acetatequinase-contg. substance, high polymer-solubl carrier-adenosine-5'-triphosphate bonded substance (I and acetylphosphoric acid (II).

Pref. (I) is a bonded substance of high polymer-solu carrier with adenosine-5'-triphosphate via a covalent Pref. (II) is acetylphosphoric acid contained in glutathi synthetase-contg. substance and/or acetatequinase-con substance.

Glutathione can be produced continuously by ferment using the above method. It is useful for treating hepati diseases or as an antidote. 10.3.78 as 028008 (8pp69)

KYOW ★ D16 79985B/44 ★J5 4122-

Fermentative prodn. of L-glutamic acid - using lysozyme-sensit strains of Corynebacterium or Brevibacterium which are unaffec by high biotin conc.

KYOWA HAKKO KOGYO KK 14.03.78-JA-028821

B05 E16 (22.09.79) C12d-13/06

The method is to prepare L-glutamic acid by culturing L-glutamic acid-prodcible bacteria belonging to Corynebacterium or Brevibacterium in a culture medium and recovering L-glutamic acid accumulated in the culture medium, improvement comprises using a lysozyme-sensitive bacterial strain, in which L-glutamic acid production is not suppressed by excessive biotin present in the culture medium.

Corynebacterium glutamicum KY9703 (FERM-P 4412, NRRL 11271), C. glutamicum KY9705 (FERM-P 4413, NRRL 11272) and Brevibacterium flavum KY9733 (FERM-P 4414, NRRL 11273) can be used. Those strain are the varieties derived from the parent strains of Corynebacterium glutamicum ATCC 13032 and Brevibacterium flavum ATCC 14067. The culture is affected aerobically at 24-37°C (28-33°C) at pH 6-9 for 1-3 day

L-glutamic acid can be prepared advantageously with high yield without suppression by biotin even in a culture medium containing large amount of biotin. Thus inexpensive materials contg. large amount of biotin such as molasses, starch hydrolysate, etc. can be used as the culture medium. 14.3.78. as 028821 (6pp5)

SUGI/ ★ D16 80013B/44 ★J5 4123-094

Quantitative assay of lactic acid bacteria - by extracting ATP with boiling water and determining the extracted ATP by luciferin-luciferase reaction

SUGIURA M 17.03.78-JA-029871

J04 R16 (25.09.79) G01n-31/14 G01n-33/04

A method for quantitative assay of lactic acid bacteria comprises treating the tested bacteria with boiling water (or perchloric acid) to extract ATP (adenosine triphosphate) followed by determining the extracted ATP by means of luciferin/luciferase reaction, wherein the lactic acid bacteria to be tested is incubated in buffer soln. (especially buffer soln. of pH 7-9) contg. a culture medium for the bacterial (e.g., a composition contg. 2-5 pts. of glucose, 1-3 pts. of peptone, 0.5-3 pts. of yeast extract, 0.01-0.1 pt. of magnesium salt and 0.1-0.5 pt. of calcium carbonate) and hexokinase, to enrich the intracellular ATP.

The method is used for rapid assay of lactic acid bacteria. The incubation in the presence of hexokinase converts ATP outside the bacteria cells into ADP inert to the luciferin/luciferase mixt., to exclude the interference caused by the extracellular ATP.

Specifically, the bacteria, culture medium and hexokinase are mixed with the buffer soln. (pref. Mg^{++}-contg. soln.) and the mixt. is incubated for 1-5 hours at 37°C. The hexokinase is deactivated by boiling for 2-10 minutes, etc., and the intracellular ATP extd. by this treatment is then determined by reaction with luciferin/luciferase mixt. in the presence of Mg^{++} ion and measuring the intensity of the resulting luminescence. 17.3.78. as 029871 (9pp173)

TAKEDA CHEMICAL IND KK 15.11.71-JA-091390
*B02 C02 (04.10.79) *NL7215-283 C12d-09/04*

Cephalosporin C is obtained by incubating Cephalosporium polyaleurum 199 or Y-505 (ATCC 20359 and 20360 resp.) in a suitable medium of pH 3-10 (pref. 5-8), for 10-360 (pref. 48-240) hrs., at 15-37 (20-32)°C. The broth is filtered, washed with a solvent, e.g. BuOAc to extract helvolinic acid which is also produced and then purified by alternate charcoal and ion exchange chromatography, to eliminate the small ($\leqslant$ 10% w/w) quantity of penicillin N which is likewise produced. 15. 11. 71 as 091390 C12d-9/04 (4. 10. 79) TAKEDA CHEMICAL INDS LTD. Beta-Galactosidase-detecting diagnostic test system - contg. ortho nitrophenyl beta-D-galactopyranoside substrate
WARNER-LAMBERT CO 30.09.74-US-510816
*B04 R16 (06.10.79) *DT2531-982 G01n-31/14 G01n-33/16*

Diagnostic test system for detecting the formation of β-galactosidase consists of an absorbent material containin per test unit (a) a substrate zone with 0.05 to ca 3.0 mg of dry o-nitrophenyl β-D-galactopyranoside (I) and (b) a buffer zone, adjacent to the substrate zone, with ca 0.01-9.1 m mol of a dry buffer system which provides a pH of ca 6.5-8.5.

A procedure for identifying and differentiating micro-organisms which produce β-galactosidase comprises (i) immersing the substrate and buffer zones of the test system in ca 0.3 ml of a suspension of an unknown culture in physiological saline in a test tube, (ii) incubating the tube ca 4 hrs. at ca 35-37°, and (iii) examining the liquid in the test tube for the presence of a yellow colour as a positive indication of the presence of β-galactosidase-producing microorganisms.

Used for differentiation between Enterobacteriaciae on the basis of their ability to hydrolyse (I) due to the presence of β-galactosidase. Provision of substrate and buffer as adjacent but separate zones gives a stable and sensitive test strip that can be used for the rapid identification of microorganisms. 31. 7. 75 as 093648 (clg. 30. 9. 74-US-510816) G01n-33/16; 31/14 (6. 10. 79) WARNER-LAMBERT CO. BOFO D16 31921X/18 =J7 9031-397
Polypeptide chromogenic substrates for serine proteases - used to determine blood coagulation factor XA
BOFORS AB 05.12.74-SW-015229
*B04 R16 +P31 (06.10.79) *BE-836-085 G01n-31/14 G01n-33/16*

Chromogenic substrates for serine proteases, esp. for diagnostic determination of Xa factor are of formula: R_1-A_1-A_2-Gly-Arg-NH-R_2, (I) and salts (where R_1 = H, 1-12C alkanoyl, cyclohexylcarbonyl, benzoyl (opt. substd. e.g. by one or two halo atoms, methyl, amino or phenyl) benzenesulphonyl or toluenesulphonyl; R_2 = nitrophenyl, naphthyl, nitronaphthyl, methoxynaphthyl, quinolyl or nitroquinolyl; A_1 = a bond or one of the amino acids Gly, Ata, Val, Leu, Ileu, Pro, Met, Phe or Tyr and A_2 = Glu, Gln, Asp or Asn). Cpd. is specific. benzoyl-Ileu-Glu-Gly-Arg-p-nitroaniline (cpd. A). Substrates are suitable for determination of factor Xa (E.C. 3.4.21.6) or study its reactions.

Factor X is a key substance in the series of reactions leading to coagulation of blood. Activation of factor X involves formation of the proteolytic enzyme, factor Xa which is directly responsible for conversion of prothrombin to thrombin. The hydrolysis of (I) by Xa gives a totally different UV spectra e.g. Cpd. A HCl has a maximum absorption at 315 nm and molar extinction coefficient of 12000 and insignificant absorption at 405 nm. p-Nitroaniline formed in the enzymatic hydrolysis has a maximum absorption at 380 nm with a molar extinction coefficient of 13200 which decreases only to 9620 at 405 nm.

Thus spectrophotometric measurement at 405 nm may be used to follow the hydrolysis. Cpd. A is also an active substrate for trypsin. 4. 12. 75 as 143426 (clg. 5. 12. 74-SW-015229) G01n-33/16; 31/14; 31/22 (6. 10. 79) BOFORS AB (8pp) (J51083595)

Processing fruit or grape pressings - by extracting with vinasse to give improved nutritive value liquor for wine and beverage mfr.
MOSKAZENKO R I 06.01.76-SU-311888
(18.02.79) A23l-02/02

Diffusion liquor is obtained from fruit or grape pressings by using an extractant to remove from the pressings residual soluble substances. To improve the nutritive value of the liquor as a finished product, the extractant is vinasse, obtained as a waste product in wine-making.

Pressings from a screw press are fed to a continuous extractor filled with vinasse in a vinasse-pressings ratio of 2:3 and at 30-40°C. The mixture is then pressed and the liquor is used to produce natural wines, juices, non-alcoholic beverages and alcohols.

Microbial protein prodn - using mineral oils as substrate culture medium being force-circulated via fermentation vessel and external cooler
SOC PROD NESTLE SA 28.05.74-CH-007249
*(20.02.79) *BE-828-763 C12b-01/10*

In the prodn. of protein by aerobic growth of micro-organisms in a feed fluid providing a supply of carbon for assimilation, the micro-organisms and culture medium are circulated in a closed circuit between two different levels. The culture medium rises to the upper level via a fermentation vessel as bubbles of oxygen, or oxygen-rich gas, rise from a press. inlet at the bottom of the vessel, the medium being simultaneously rotated about the vertical axis by an agitator which also urges the medium upwards in the vessel.

The culture medium is pref. cooled as it circulates outside the vessel. Culture medium rising out of the top of the fermentation vessel is then pref. partly degassed, cooled, split into two fractions, one of which is separated to yield cellular product while the other fraction is enriched with feed fluid and recycled via the fermentation vessel.

Used for prodn. of proteins from mineral oils, partic. for high rate industrial prodn. of the order of 10-20 g. of cellular prod. per litre of culture medium per hr. Reduced power for highly efficient dispersion of gas in culture medium is possible high plate circulation gives high output potential with excellent cooling. Adaptable to suit widely different cultures.

Beta-lactamase inhibitor MM 4550 - isolated from product of Streptomyces culture, for use in antibacterial medicaments

BEECHAM GROUP LTD 28.03.74-GB-013855

*B04 (23.10.79) *DT2513-855 A61k-35*

Pharmaceutically acceptable dibasic salt of MM4550A which is $\geqslant$ 70% pure is described. MM4550A is a solid carboxylic acid of molecular formula $C_{13}H_{16}O_9N_2S_2$.

In the form of its pure Na salt the acid (a) has UV absorption maxima at 238 nm and 287 nm, in aq. soln.; (b) has ir absorption maxima at 3450, 2950, 1765, 1695, 1510, 1390 and 1260 cm^{-1} as 0.4% w/w KBr disc; (c) has nmr spectrum showing (i) pair of low field doublets centred at 2.45τ and 3.65τ with coupling constant 15Hz; (ii) doublet centred at 8.55τ, and (iii) a sharp singlet at 7.95τ; (d) possesses antibacterial activity against strains of Staphylococcus aureus, Bacillus subtilis, Escherichia coli, Klebsiella aerogenes, Proteus mirabilis, Acinetobacter anitratus, Serratia marcesceus and Shigella sennei; (e) synergises antibacterial activity of ampicillin against certain β-lactamase producing strains, and (f) is not a polypeptide or protein.

The cpd. can be obtd. by fermentation of strains of Streptomyces olivaceus. 24. 8. 76 as 717197 (17pp424)

Cigarette substitute contg. vapour-releasing material - esp. synthetic foam impregnated with

JACOBS W 13.04.78-NL-003911

P15 (16.10.79) A24d-01/18

A substitute cigarette comprises a tubular casing filled with a synthetic foam which has been satd. with aromatic material, and which is fitted into the cigarette in wads. These wads are enclosed between two porous end locations, which act as filters.

The substitute can also be made in cigar form. The oil used for satn. of the foam is composed of e.g. 33% menthol, 30% acetone/wintergreen, 2% lavender and 1% isotones. Alternatively, a granular aromatic substance can be used, such as aniseed. The substitute cigarette or cigar does not need to be lit, it being sufficient for the vapours of the aromatics to be inhaled. 13.4.78 as 003911. (5pp1161)

LEAT= ★ D18 80316B/44 ★SU-645-964

Compsn. for treating hides before tanning - contg. common salt sulphuric acid, surfactant, alum and potassium bi:chromate and water

LEATHER FOOTWEAR 09.01.73-SU-876758

E31 (E33) (05.02.79) C14c-01

The intensity of the subsequent tanning is increased by adding to the salt and acid compsn. a surfactant, alum and potassium bichromate.

The compsn. contains (in wt.%) common salt 2-8, alum 1-5, potassium bichromate 0.3-0.5, a surfactant 0.3-0.5, H_2SO_4 0.4-0.8; the balance is water.

Treatment with this compsn. facilitates the subsequent penetration of basic chromium salts deep into the hide. The resistance of the material to compressive deformation during the subsequent drying is increased. The alum penetrates deeply into the hide. The chrome-tanning is accelerated.

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

An alloy, for use in dental applications, has the compsn. (by wt.) 65-80% Ni, 12-20% Cr, 3.5-5.0% Si, 3.0-6.0% Mo, and 0.2-0.6% B. It has a fusion temp. of 2500-2450°F, a tensile strength of $\geq$80,000 psi, and a coefft. of expansion of 13.6-14.5 x 10^{-6} in/in/°C.

Also claimed are (a) a dental restorative construction consisting of a shaped core of the alloy and a bonded porcelain covering; and (b) a method of preparing (a) by casting the core, covering it with a porcelain having a coefft. of expansion of 10-21 x 10^{-6} in/in/°C, and firing the porcelain onto the core.

The alloy is used as a replacement for the heavier and more expensive gold for artificial teeth, crowns, bridges, inlays and outlays. The alloy has good corrosion resistance and oxidation resistance, an UTS of 80,000-120,000 psi (cf. 65,000-90,000 psi for gold), an elongation of 2-5% a Rockwell B hardness of 90-100 (cf. 86 for gold) and improved polishability over prior art non-precious alloys (a lustre equivalent to gold is obtd. with only slightly more effort than required to polish gold), it can be remelted and cast without loss of physical properties, may be used with presently employed dental solders, may be faced with dental plastics materials such as acrylics, and does not contain metals which stain porcelain or plastics coatings. The alloy bonds well to porcelain, giving a bonding strength of $>$ 5000 psi.

Bulked absorbent napkin insert - formed by meshes in two laye increase production speeds of disposables
PAPER CONVERTING MA 16.05.74-US-470535
*F04 +P21 P27 P73 (25.10.79) *DT2519-131 D04h-01 +A 13/02 A47g-09 B32b-23/10*

Double-layer fluff inserts for absorbent articles, e.g. napkins, are produced by depositing the two fluff layers on separate endless belt screens, as the cellulose shre leave the hammer mills.

After deposition on inclined sections by gravity and vacuum, the first fluff layer is removed by the vacuum applied to a back-up roll and turned through 180° so tha its screen side lies in contact with a carrier web which consists of an air-permeable material. The second fluf layer is laid on the first so that its screen side remains on the outside of the combined strand.

The more densely packed fibres of the fluff layers w now form the outsides of the double layer result in grea mechanical strength and a better distribution of its abso bent properties. Less power is required for the prodn. and the output rate is higher. 29.4.75 as 519131 (8pp39)

terilisation chamber lid closure - by hand-wheel turning wedging evers between flanged recess and lid

HERZ H 13.04.78-DT-816063
P34 (25.10.79) A61l-03 B01j-03/04

A pressurised treatment chamber esp. for sterilisation lant, is closed by a lid which is pressed against a sealing strip around the chamber opening. Several thrust levers are wedged between the recess of a flange and the outside rim of the lid. The pressure to the levers is applied by a handwheel which can be screwed up on a central boss of the lid and moves the inside ends of the thrust levers in ball Joints attached to the outer race of a double-row self-aligning ball bearing.

This ensures that all areas of the lid periphery are pressed with the same force against the seal ring and that only little force is needed to tighten the lid. 13.4.78 as 816063 (14pp39)

Cleaning and disinfecting flushing toilet - with separate dispensers for dissolving surfactant cake and solid disinfectant in water

PROCTER & GAMBLE CO 18.04.78-US-897479
P34 Q42 (31.10.79) A61l-03 E03d-09/03
D/S: E(BE, DT, FR, GB, IT, NL).

A method for cleaning and disinfecting a flushing toilet each time the toilet is flushed comprises forming a surfactant-containing solution by exposing a solid cake of surfactant to water in a first passive dispensing apparatus immersed in the toilet tank. The cake and solution are isolated from the surrounding water.

Similarly a solid disinfectant is dissolved in water in a second passive, immersed, dispensing apparatus, the solution being isolated from the surrounding water.

On flushing the toilet the water level drops in the tank and predetermined quantities of the surfactant-containing solution and disinfectant-containing solution are discharged into the tank in response to the change in water level.

The method is simple to carry out, is economical and reliable. The product dispensers used are sized relative to each other so that the product components are consumed at the same time to minimize wastage.

9.4.79 as 200173 (37pp295).

Air conditioning system for greenhouse - also produces soft water from hard water heated by optical filter trapping solar energy

COMMISS ENERGIE ATOMIQUE (INRG) 13.04.78-FR-010910
P13 Q74 (D15) (31.10.79) A01g-09/24 C02b-01/06 F24j-03/02
Full Patentees: Commissariat a l'Energie Atomique; Institute National de la Recherche Agronomique.
D/S: E(DT, GB, IT, NL).

The greenhouse is used for growing plants for which only a selected range of wavelengths of solar radiation is useful. During daylight hours, optical filters which pass only the selected wavelengths are positioned between the plants and the radiation. Hard water is film-flowed over the filter surfaces to pick up heat resulting from solar energy absorbed by the filters. The resulting hot water is stored.

At night, the greenhouse is warmed by returning the hot water to vaporise in the greenhouse. Some of the vapour condenses on cold wall surfaces of the greenhouse. The condensate is collected as soft water for use in irrigation of the plants etc.

The optical filters pref. pivot to 'fold up' at night to facilitate vapour rising to the cold wall of the greenhouse.

The arrangement is used for air conditioning a greenhouse 24 hours a day. Daytime overheating by solar radiation is prevented and absorbed heat is recycled overnight.

Hard water, partic. seawater or other normally unusable water, is used as the heat transfer and heat storage fluid. At the same time, the water is purified and made suitable for feeding to plants etc.
10.4.79 as 400232 (28pp448).

Control of bleeding of internal mammalian lesions - by using endoscope for examination and for delivery of polymerising adhesive
MINNESOTA MINING CO 17.03.78-US-887487
A96 B07 G03 P34 (A14 A81) (31.10.79) A61m-11

Bleeding of internal mammalian lesions is controlled with an adhesive. An endoscope comprising a control section and a cannula having a distal end, a proximal end and an interior channel(s) connecting the ends of the cannula is used. The cannula of the endoscope is positioned in the mammal so that the distal end is directed towards the lesion. Then the lesion is sprayed with a rapidly polymerising adhesive to form a film over the lesion, the spray being introduced through a channel in the cannula.

Surgical invasion of the body is avoided in treating wounds, esp. gastric ulcers where surgical risk is increased. The usual poor visual examination of the wrinkled and folded mucosal surfaces and complicated diagnostic and treatment procedures are avoided. 16. 3. 78 as 009362 (8pp1248)

Highly water-dispersible lecithin prepn. from oil:seed - by ternar hydrocarbon-alkanol-water extraction, and azeotropic distn. c water then solvents

STALEY A E MFG CO 19.04.78-US-897969

E11 (31.10.79) A23j-07 C07f-09/10 C11b-01/10

D/S: E(BE, DT, FR, GB, NL).

Prepn. of oilseed comprises solvent extraction with a ternary solvent system contg. an oleophilic hydrocarbon (I), a lower alkanol (II) (miscible with (I) and H_2O), and H_2O to produce as one of the extracted materials a full miscella contg. crude oil, phosphatides, and the ternary solvents. The full miscella are sepd. into 2 layers and the sepd. upper phase (contg. crude oil, phosphatides, and solvent mixt. with ratios at least equal to the ratios of the respective solvents in the ternary azeotrope produced from the mixt.) is heated so that all H_2O present is removed by azeotropic distn., leaving a non-aq. liq. phase contg. oil and phosphatides.

Using azeotropic distn., the energy efficiency method yields phosphatides (i.e. commercial grade lecithin) possessing good H_2O-dispersibility. In addn., the handling of the oil-bearing miscella is improved. The lecithin may be used in foods and many industrial applications. It is an excellent emulsifying agent and has good wetting props. It may also be used in liq. animal feeds.

Non-toxic cleaning compsn. - contg. N-acyl-glutamate and alkyl phosphate or polyoxyethylene alkyl phosphate
AJINOMOTO KK 14.03.78-JA-028823
E19 (D21) (19.09.79) A61k-07/06 C11d-01/83

Cleaning compsn. contains (a) N-acylglutaminate and (b) alkylphosphate or polyoxyethylenealkylphosphate. Pref. the acyl is a residue of a 8-22C fatty acid (e.g., 2-ethylhexanoyl, lauroyl, palmitoyl, stearoyl, oleoyl, acylated mixed fatty acids). Pref. salts of Li, Na, K, NH_4, alkyloamine and basic aminoacid are used.

Compsn. is harmless and non-stimulating to skin and hair. It has prominent foaming and cleaning powers, and is useful as material for solid soap, shampoo and tableware cleaner. 14.3.78. as 028823 (4pp170)

NIGO- ★ D25 79837B/44 ★J5 4122-224
Sulphation of organic cpds. with sulphamic acid - using catalyst prepd. from organic, inorganic or aromatic acid and urea
NIPPON GOSEI SENZAI 13.03.78-JA-027688
B05 E19 (D21) (21.09.79) B01j-31/02 C07c-139 C07c-141/02

In sulphating aliphatic or aromatic compounds (having hydroxy or polyether groups which are formed by addn. of alkylene oxide to hydroxy gps) with sulphamic acid, the improvement is that the reaction is carried out in the presence of a catalyst prepd. by combining an inorganic acid, organic acid or aromatic sulphonic acid which donate hydrogen ions and urea.

In sulphation with sulphamic acid in the prior art using urea, the urea combines with the sulphamic acid to give granular solids which decrease the reaction rate greatly. The combined use of the cpds. removes such a disadvantage. The process may be applied to prepn. of raw material (ammonium salts of sulphates) and detergents, cosmetics, shampoo, soaps and medicines.

Said aliphatic or aromatic cpds. to be sulphated include: naturally occurring or synthetic higher alcohol-ethylene oxide adducts, higher fatty acid glycerin monoester-higher fatty acid propylene glycol monoester-ethylene oxide adduct, alkylphenol ethylene oxide adduct; synthetic sec higher alcohol-ethylene oxide adduct; lanolin alcohol-ethylene oxide adduct, cholesterol-ethylene oxide adduct; steroidal hormones, and alcohols having triple bonds. Said acid catalysts include AcOH, TsOH, and phosphori oxyacids (e.g. orthophosphoric acid, metaphosphoric a pyrophosphoric acid). 13.3.78. as 027688 (8pp52)

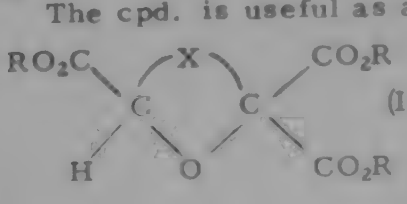
5-Bromo-5,5-di:carboxyethyl-valeraldehyde di:ethyl acetal - useful as intermediate for tetra:hydro-pyran 1,4 dioxan- or THF type detergent builder cpds.

MONSANTO CO 27.07.78-US-928747 (05.01.77-US-756946)
E13 (D15) (23.10.79) C07c-69/62

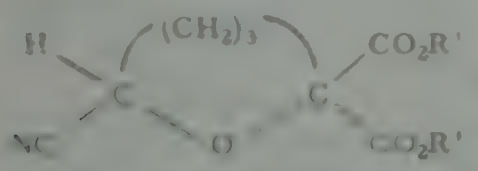
A new cpd. is 5-bromo-5,5-dicarboxyethylvaleraldehyde diethyl acetal of formula $C(CO_2C_2H_5)_2Br\text{-}(CH_2)_3\text{-}CH(OC_2H_5\text{-})_2$.

The cpd. is useful as an intermediate in the prepn. of



(I)

cpds. of formula (I) which are useful(in salt form) e.g. as water softeners, detergent builders, calcium and magnes-ium sequestrants and scale dissolvers. In the formula X is selected from gps. to provide tetrahydropyran-type cpds 1,4-dioxane-type cpds. or tetrahydrofuran-type cpds.; and each R is alkali metal, NH_4^+, trialkanolammonium or $\leq$ 20C alkyl.



(II)

US 4120874 claimed other intermediates, specifically cyclic cyano diester cpds. of formula (II) (where each R' is lower alkyl).

27.7.78 as 928747 Div. ex 4120874 (6pp990)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishe accepted West German specifications (DAS) from th unexamined applications (OLS) which are given the norma DT code. in the case of Japan J5 represents th unexamined applications, and J7 the examined of th present series.
